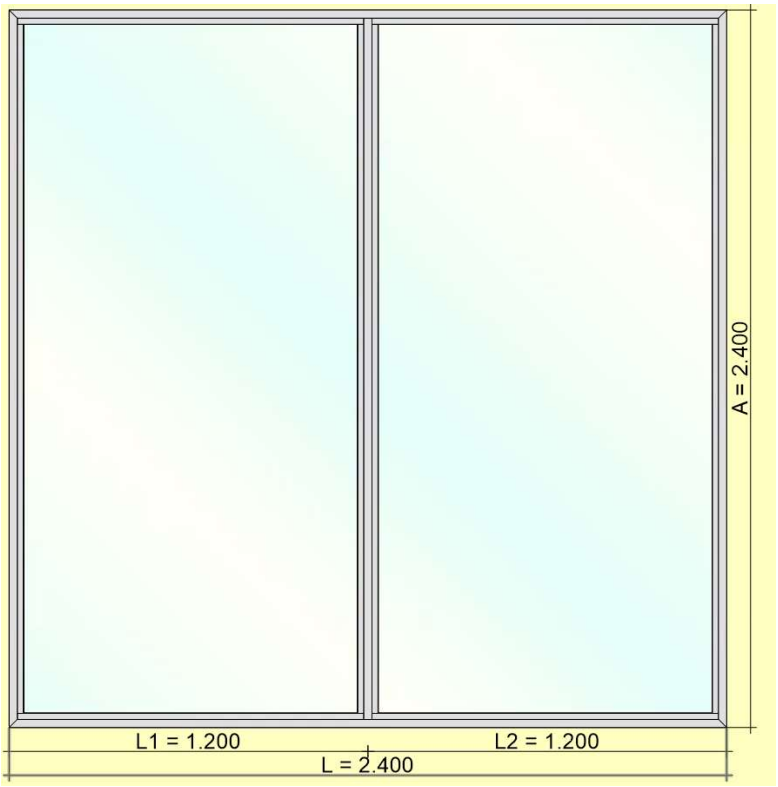
CALCULO A CARGA DE VIENTO SEGÚN NORMA UNE-EN 13830:2016



CONTROL DE EDIFICACION Y OBRAS
AREA DE INFRAESTRUCTURAS

REFERENCIA	PABELLON DE CRISTAL	FECHA	23.11.2024
CÓDIGO PROYECTO	23-0312		
OBJECTIVO	CÁLCULO PERFILERÍA A CARGA DE VIENTO SEGÚN NORMA UNE-EN 13830:2016		
SISTEMA	PERFILERÍA 68X54 mm AD-HOC.		

1 OBJETO DEL ESTUDIO.

El presente informe pretende servir de base para la justificación de las prestaciones mecánicas de la carpintería en cuanto a su resistencia y estabilidad frente a la carga de viento.

El cálculo mecánico se realiza para la justificación del travesaño vertical intermedio, en los módulos de proyecto fijos de dimensiones 2400x2400 mm. bajo la carga de viento calculada a partir de DB SE-AE del CTE.

2 DATOS DEL PROYECTO.

- Ubicación: Avenida Principal 16, Madrid
- Grado de aspereza: IV (zona urbana en general, industrial o forestal)
- Zona eólica: A
- Propiedad: Madrid Destino

Rehabilitación de edificio existente. Imágenes de referencia del proyecto:

pabellón de cristal

3 CALCULO DE LA CARGA DE VIENTO SEGÚN DB SE-AE DEL CTE.

Según el capítulo 3.3 del DB SE-AE, la acción del viento (presión estática q_e) puede expresarse como:

$$q_e = q_b * Ce * C_p$$

q_b - Presión dinámica del viento en función de la zona eólica

C_e - Coeficiente de exposición

C_p- Coeficiente de presión

Presión dinámica, q_b

La presión dinámica del viento viene determinada por la fórmula

$$q_b = 0{,}5 \cdot \rho \cdot v_b^2$$

ρ – densidad del aire (en general puede adoptarse el valor de 1,25 kg/m3)

v_b - valor básico de la velocidad de viento

Este último factor, viene determinado por el mapa D.1 del Anejo D del DB-SE-AE. Al estar en zona eólica A, el valor de velocidad básica del viento es de 26 m/s y tenemos una presión dinámica: q_b = 422,5 (N/m2).

Figura 1. Mapa eólico

Coeficiente de exposición, C_e

El coeficiente de exposición tiene en cuenta los efectos de las turbulencias originadas por el relieve y la topografía del terreno. Su valor se obtiene de la tabla 3.4 del DB-SE-AE, siendo la altura del punto considerado la medida respecto a la rasante media de la fachada a barlovento.

Los valores proporcionados por la tabla corresponden a edificios menores de 30 m de altura. A efectos del grado de aspereza, el entorno del edificio se clasificará en el primero de los tipos de la tabla 3.4 del DB-SE-AE al que pertenezca, para la dirección de viento analizada.

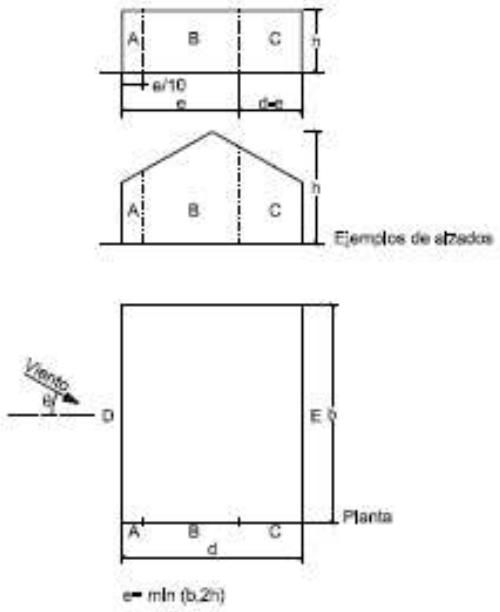
Tabla 3.4. Valores del coeficiente de exposición c_e

	Grado de aspereza del entorno	Altura del punto considerado (m)							
		3	6	9	12	15	18	24	30
I	Borde del mar o de un lago, con una superficie de agua en la dirección del viento de al menos 5 km de longitud	2,2	2,5	2,7	2,9	3,0	3,1	3,3	3,5
II	Terreno rural llano sin obstáculos ni arbolado de importancia	2,1	2,5	2,7	2,9	3,0	3,1	3,3	3,5
III	Zona rural accidentada o llana con algunos obstáculos aislados, como árboles o construcciones pequeñas	1,6	2,0	2,3	2,5	2,6	2,7	2,9	3,1
IV	Zona urbana en general, industrial o forestal	1,3	1,4	1,7	1,9	2,1	2,2	2,4	2,6
V	Centro de negocio de grandes ciudades, con profusión de edificios en altura	1,2	1,2	1,2	1,4	1,5	1,6	1,9	2,0

En el caso que nos ocupa, se ha considerado el grado de aspereza IV. La altura del punto considerado, se aplicará al punto medio del elemento de cálculo sobre rasante. Se han establecido 10 niveles en altura, siendo la altura del punto medio de cada uno de ellos la siguiente (los niveles se denominan de arriba abajo empezando por el 0 como más alto y el 9 el más bajo según la documentación recibida):

- Nivel 0 – 24 m.
- Nivel 1 – 22 m.
- Nivel 2 – 19.5 m.
- Nivel 3 – 17 m.
- Nivel 4 – 14.5 m.
- Nivel 5 – 12 m.
- Nivel 6 – 9.5 m.
- Nivel 7 – 7 m.
- Nivel 8 – 4.5 m.
- Nivel 9 – 2 m.

Coeficiente eólico o de presión, C_p



Su valor depende de la forma y orientación de la superficie respecto al viento de cada fachada y, en el caso de los estudios de elementos de cerramiento, de la superficie del elemento. El coeficiente de presión se obtiene de la fórmula:

$$C_p = C_{pi} + C_{pe}$$

C_{pi} - coeficiente de presión interna

C_{pe} - coeficiente de presión externa

Se ha supuesto un coeficiente de presión interna igual a 0, al tratarse de un edificio que no presenta grandes huecos predominantes en fachada que puedan provocar presiones internas. Dado que los módulos a estudio son todos fijos, se considera una permeabilidad baja. El coeficiente de presión externa se ha realizado teniendo según el Anejo D.3 del DB-SE-AE. Se diferencian entre zonas de esquina A, y zonas centrales B.

A (m^2)	h/d	Zona (según figura), $-45° < \theta < 45°$				
		A	B	C	D	E
≥ 10	5	-1,2	-0,8	-0,5	0,8	-0,7
	1	"	"	"	"	-0,5
	≤ 0,25	"	"		0,7	-0,3
5	5	-1,3	-0,9	-0,5	0,9	-0,7
	1	"	"	"	"	-0,5
	≤ 0,25	"	"	"	0,8	-0,3
2	5	-1,3	-1,0	-0,5	0,9	-0,7
	1	"	"	"	"	-0,5
	≤ 0,25	"	"	"	0,7	-0,3
≤ 1	5	-1,4	-1,1	-0,5	1,0	-0,7
	1	"	"	"	"	-0,5
	≤ 0,25	"	"	"	"	-0,3

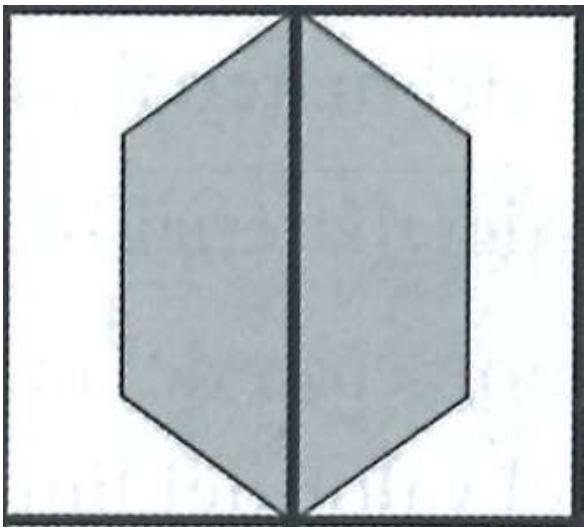
- Coeficiente de presión en zona de esquina A: -1.32
- Coeficiente de presión en zona central B: -0.98

TABLA RESULTADO DE CARGAS DE VIENTO POR NIVEL:

NIVEL	ALTURA (m)	Qv zona A (kg/m2)	Qv zona B (kg/m2)
9	2	74,51	55,31

8	4.5	74,51	55,31
7	7	86,28	64,04
6	9.5	97,49	72,36
5	12	106,41	78,98
4	14.5	113,85	84,51
3	17	120,25	89,26
2	19.5	125,88	93,44
1	22	130,92	97,18
0*	24	136,79	103,19

* El nivel 0, o planta superior, solo presenta módulos de altura máxima 2.00 m.



4 COMPROBACIÓN DE ESTADO LÍMITE DE SERVICIO Y ESTADO LÍMITE ÚLTIMO

A efectos de garantizar la resistencia mecánica de los travesaños verticales de la fachada se ha verificado:

1- Comprobación del estado límite de servicio

2- Comprobación del estado límite último

Al tratarse de un módulo que perimetralmente está fijado a la estructura del edificio, el área de incidencia de carga de viento se calcula con una geometría trapezoidal:

En cuanto al estudio de los estados límite de servicio, según la norma europea UNE-EN 13830:2016, la flecha frontal máxima admisible de los travesaños debidos a la acción del viento es de L/200 para longitudes entre apoyos inferiores a 3 m. En el caso de estudio se tiene una altura de travesaño de 2400 mm → flecha máxima de 1.2 cm.

La comprobación del estado límite último, se realiza con la mayoración de las cargas según la tabla siguiente, y considerando los valores del aluminio aleación 6063T5 con módulo de elasticidad de 700.000 kg/cm2 y una tensión admisible de 110 N/mm2.

Tabla 4.1 Coeficientes parciales de seguridad (γ) para las acciones

Tipo de verificación (1)	Tipo de acción	Situación persistente o transitoria	
		desfavorable	favorable
Resistencia	Permanente		
	Peso propio, peso del terreno	1,35	0,80
	Empuje del terreno	1,35	0,70
	Presión del agua	1,20	0,90
	Variable	1,50	0
		desestabilizadora	estabilizadora
Estabilidad	Permanente		
	Peso propio, peso del terreno	1,10	0,90
	Empuje del terreno	1,35	0,80
	Presión del agua	1,05	0,95
	Variable	1,50	0

(1) Los coeficientes correspondientes a la verificación de la resistencia del terreno se establecen en el DB-SE-C

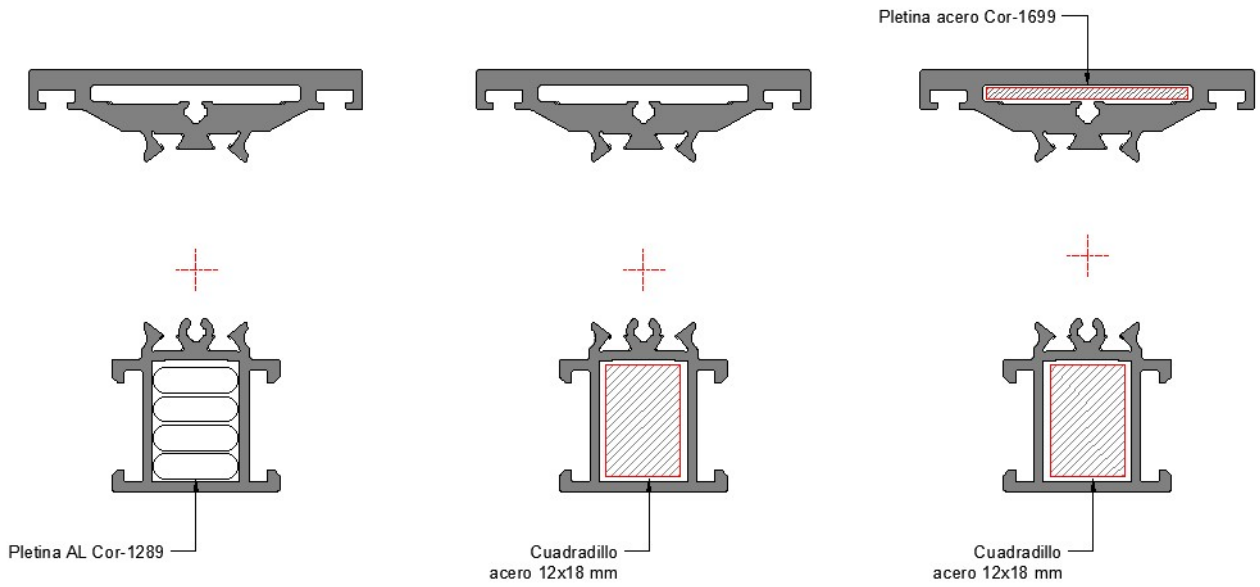
El cálculo del momento de inercia mínimo a cumplir en el ELS para una flecha máxima de 1,2 cm nos establece una serie de valores dependiendo del nivel del módulo y de la zona del edificio (esquina o central de fachada).

Momento de Inercia solicitado para *fachada panel*:

$$Iz = Iz_1 + Iz_2$$

$$Iz_1 = \frac{qv \cdot (b/2) \cdot a^4}{1920 \cdot E \cdot F_{max}} \cdot \left[5 - 4 \cdot \left(\frac{c_1^2}{a^2}\right)\right]^2$$

$$Iz_2 = \frac{qv * (c/2) * a^4}{1920 * E * F_{max}} * \left[5 - 4 * \left(\frac{c_2^2}{a^2}\right)\right]^2$$



Si a > b:	Si a ≤ b:
$C_1 = 2 * \left[\frac{\left(\frac{b}{2}\right)^2}{a}\right]$	$C_1 = \frac{a}{2}$
Si a > c:	**Si a ≤ c:**
$C_2 = 2 * \left[\frac{\left(\frac{c}{2}\right)^2}{a}\right]$	$C_2 = \frac{a}{2}$

NIVEL	Qv zona A (kg/m2)	Ix (cm4)	Wx (cm4)	Qv zona B (kg/m2)	Ix (cm4)	Wx (cm4)
9	74,51	**44,84**	**6,25**	55,31	**33,28**	**4,64**
8	74,51	**44,84**	**6,25**	55,31	**33,28**	**4,64**
7	86,28	**51,92**	**7,24**	64,04	**38,54**	**5,37**
6	97,49	**58,67**	**8,18**	72,36	**43,55**	**6,07**
5	106,41	**64,04**	**8,92**	78,98	**47,53**	**6,62**
4	113,85	**68,52**	**9,55**	84,51	**50,86**	**7,09**
3	120,25	**72,37**	**10,08**	89,26	**53,72**	**7,49**
2	125,88	**75,76**	**10,56**	93,44	**56,23**	**7,84**
1	130,92	**78,79**	**10,98**	97,18	**58,48**	**8,15**
0*	136,79	**46,35**	**7,97**	103,19	**34,97**	**6,01**

* El nivel 0, o planta superior, solo presenta módulos de altura máxima 2.00 m.

5 RESULTADOS POR MÓDULOS

En el desarrollo del proyecto se tienen 3 opciones de travesaño vertical, dependiendo de sus características mecánicas:

TRAVESAÑO + REF. COR-1289 – TRAV1

- *Ix: 50,93 cm4*
- *Wx: 14,22 cm3*

TRAVESAÑO + REF. AC 12X18 mm – TRAV2

- *Ix: 77,82 cm4**
- *Wx: 21,73 cm3*

TRAVESAÑO + REF. AC COR-1699 + AC 12X18 mm – TRAV3

- *Ix: 96,51 cm4**
- *Wx: 25,39 cm3*

** Valores de inercia equivalente en aluminio.*

Según los siguientes valores, y la tabla de necesidades mecánicas del capítulo anterior, se podría realizar la siguiente optimización de uso de travesaños cumpliendo tanto el Estado Límite de Servicio (inercia mínima) y el Estado Límite Último (módulo resistente mínimo).

Cualquiera de las opciones cumpliría en todos los módulos del proyecto respecto al Estado Límite Último, dado que el módulo resistente más desfavorable es de 10,98 cm3, inferior a los valores de las 3 opciones.

Por lo tanto, la limitación viene marcada por el cumplimiento del Estado Límite de Servicio.

NIVEL	Qv zona A (kg/m2)	Ix (cm4)	Travesaño	Qv zona B (kg/m2)	Ix (cm4)	Travesaño
9	74,51	**44,84**	**TRAV1**	55,31	**33,28**	**TRAV1**
8	74,51	**44,84**	**TRAV1**	55,31	**33,28**	**TRAV1**
7	86,28	**51,92**	**TRAV2**	64,04	**38,54**	**TRAV1**
6	97,49	**58,67**	**TRAV2**	72,36	**43,55**	**TRAV1**
5	106,41	**64,04**	**TRAV2**	78,98	**47,53**	**TRAV1**

4	113,85	**68,52**	**TRAV2**	84,51	**50,86**	**TRAV1**
3	120,25	**72,37**	**TRAV2**	89,26	**53,72**	**TRAV2**
2	125,88	**75,76**	**TRAV2**	93,44	**56,23**	**TRAV2**
1	130,92	**78,79**	**TRAV3**	97,18	**58,48**	**TRAV2**
0*	136,79	**46,35**	**TRAV1**	103,19	**34,97**	**TRAV1**

* El nivel 0, o planta superior, solo presenta módulos de altura máxima 2.00 m.

6 CONCLUSIONES

El objeto del presente informe es exponer las comprobaciones de la perfilería a utilizar en el proyecto, en concreto los travesaños verticales de la solución ad-hoc desarrollada según las necesidades estéticas y dimensionales solicitadas.

Para conseguir la mayor optimización de material posible, se han desarrollado 3 opciones de refuerzo de travesaño, para cumplir en todas las situaciones del proyecto.

Las dimensiones del edificio son:

- Alzado Este/Oeste: 72,5 m.
- Alzado Norte/Sur: 127,5 m.
- Altura: 25 m.

Por lo tanto la zona de esquina A, afectará a 5 m. desde la esquina, o lo que es lo mismo a los 2 módulos de cada extremo en cada alzado.

Todas las hipótesis de carga deberán ser verificadas y aceptadas por la Dirección Facultativa (grado de aspereza, alturas entre apoyos, pesos de vidrios etc…). Así como cualquier comprobación de cálculo de carga de viento y de los resultados obtenidos.

Control de la Edificación y Obras del Área de Infraestructuras

MADRID DESTINO.

Las indicaciones e información acerca del proceso de ejecución e instalación que figuran en el presente estudio, en todo caso deben entenderse a título de simples recomendaciones que deberán ser validadas y completadas con las instrucciones de la empresa instaladores y ejecutora del proyecto, así como de la Dirección Facultativa y demás intervinientes en la obra y redacción del Proyecto, siendo Aluminios Cortizo ajeno a las posibles responsabilidades que se deriven de la ejecución e instalación del proyecto.

1. Antecedentes e información previa

La mercantil Madrid Destino, Cultura, Turismo y Negocio, S.A., traslada a CEMOSA el encargo para la **EVALUACION ESTRUCTURAL DE LOTE 2. ASISTENCIAS TECNICAS PABELLON DE CRISTAL**

El encargo se realiza bajo el contrato de SERVICIOS DE ASISTENCIA TÉCNICA ESPECIALIZADA EN MATERIA DE CONSULTORÍA DE DESARROLLO DE EVALUACIONES DE IMPACTO AMBIENTAL, CERTIFICACIONES ENERGÉTICAS, REDACCIÓN DE PROYECTO Y ESTUDIOS DE ESTRUCTURA DE FACHADA PARA EL PABELLÓN DE CRISTAL DE LA CASA DE CAMPO (Eje 2 PSTD 2022 "Actuaciones de mejora de la eficiencia energética"), con número de expediente **Nº SP23-00586.**

1.1. Documentación de referencia

Para la redacción del presente documento se ha tomado como referencia la documentación aportada por el peticionario.

Esta documentación se compone de planos "as build", planos actualizados, pliegos, documentación técnica y fotografías de la edificación.

En concreto, se ha utilizado el proyecto de ACTUACIONES DE REHABILITACIÓN DE LA FACHADA, DEL PABELLÓN DE CRISTAL (CARPINTERÍAS Y VIDRIOS), suscrito por Dª Maria Oslé Aizpuru, y fecha septiembre 2023. En este proyecto se detallan las actuaciones de renovación de la envolvente (fachadas) del edificio.

1.2. Objeto del encargo

Tal y como se especifica en la documentación contractual del encargo recibido, el objeto del mismo consiste en *la consultoría técnica referente a la rehabilitación de la fachada del Pabellón de Cristal, valorando el impacto del cambio de elementos constructivos (carpinterías, vidrios) en la estructura del edificio determinando justificando técnicamente la viabilidad de la solución propuesta en proyecto.*

1.3. Objetivo del documento

El objeto del presente documento es evaluar la factibilidad de un cambio de la carpintería de ventanas de la edificación sin que se vea afectada la integridad estructural de la misma y manteniendo su aptitud al servicio.

Para ello se definirían las cargas permanentes y variables que afectan la estructura en su estado actual, y posteriormente se introducirán las cargas correspondientes a la nueva carpintería para realizar la evaluación estructural.

Se inicia estableciendo la normativa a aplicar para la evaluación de la estructura.

2. Normativa aplicable

Si se proyectara en la actualidad una estructura metálica-hormigón como la del edificio, estaría sujeta a las siguientes normativas:

- CTE "Código Técnico de la Edificación".
- DB SA-AE "Documento básico de Seguridad Estructural - Acciones en la Edificación".
- EHE "Instrucción de Hormigón Estructural".

Para la definición y evaluación de carga actuantes (combinaciones y coeficientes), estados límites ultimo de resistencia y estado límite de servicio se utilizarán las normativas anteriormente mencionadas.

2.1. Código Técnico de la Edificación

El Código Técnico de la Edificación (CTE) en España es una normativa que establece los requisitos básicos de seguridad y habitabilidad que deben cumplir los edificios. Su objetivo principal es garantizar la calidad y sostenibilidad de las construcciones, asegurando la protección de las personas y el medio ambiente. A continuación, se detallan algunas de las funciones clave del CTE en este proyecto.

2.2. Documento básico de Seguridad Estructural

Este documento recopila todos los principios y requisitos relacionados con la resistencia mecánica y la estabilidad de los edificios, así como su aptitud para el servicio y durabilidad. Describe las bases y principios para el cálculo de estos aspectos. También aborda la ejecución, uso, inspección y mantenimiento en cuanto afectan al diseño del proyecto.

Los parámetros del DB-SE son aplicables a todos los tipos de edificios, incluidos los provisionales.

La capacidad de garantizar el funcionamiento adecuado de la construcción, el confort de los usuarios y el mantenimiento de su aspecto visual se denomina aptitud al servicio. El CTE, en ausencia de indicaciones específicas, establece un periodo de servicio de 50 años.

El DB-SE introduce un procedimiento innovador para la Evaluación Estructural de edificios existentes. Este anejo describe cómo se evaluará la aptitud al servicio de estos edificios.

2.2.1. Procedimiento de evaluación estructural de edificios existentes

En las siguientes líneas indicamos los contenidos prescritos por el CTE para la evaluación de edificios existentes:

Se realizará una verificación cuantitativa de la capacidad portante y la aptitud al servicio del edificio, considerando posibles procesos de deterioro. El procedimiento de evaluación será por fases y tendrá en cuenta:

- Condiciones actuales del edificio.
- Disponibilidad del proyecto original.
- Observación de daños estructurales.
- Uso del edificio.
- Objetivos de la evaluación.

El proceso finalizará cuando se llegue a una conclusión clara sobre la seguridad estructural o las medidas a adoptar. Si no se puede verificar la capacidad portante o la aptitud al servicio, se deberá elaborar un informe final con recomendaciones y medidas a tomar para el edificio.

El CTE establece con carácter general las siguientes fases:

1ª Fase: EVALUACION PRELIMINAR:

- Recopilación y estudio de la documentación disponible.

- Inspección preliminar y visita al edificio.
- Elaboración de bases para la evaluación.
- Verificación preliminar de la capacidad portante y aptitud al servicio de los elementos estructurales principales.

2ª Fase: EVALUACION DETALLADA:

- Determinación del estado del edificio mediante inspección detallada, incluida cuantificación de daños.
- Actualización de las acciones.
- Actualización de las bases para la evaluación.
- Análisis estructural.
- Verificación de la capacidad portante y de la aptitud al servicio.

3ª Fase: EVALUACION AVANZADA:

- Determinación de situaciones de dimensionamiento determinantes.
- Adquisición de más datos sobre características de estructura, materiales o acciones.
- Determinación de nuevas acciones actuantes.
- Análisis estructural.
- Verificación con métodos de seguridad.

2.2.2. Análisis estructural

Tendrá en cuenta la situación del edificio y sus mecanismos de deterioro. Deberá contemplar los estados límites últimos y los estados de servicio. Se deberán determinar las siguientes variables básicas para el análisis:

- Acciones permanentes y variables.
- Dimensiones de estructura y sus elementos.
- Condiciones geotécnicas y características del terreno.
- Propiedades de los materiales.

2.2.3. Verificación de capacidad portantes (E.L.U)

La verificación de Estados Límite Últimos (E.L.U) es un proceso crucial que garantiza la seguridad y la estabilidad estructural de una construcción. E.L.U se refiere a los estados en los que la estructura podría fallar debido a cargas extremas o condiciones adversas. Esta verificación implica el análisis y cálculo de las fuerzas mayoradas y tensiones máximas que la estructura puede soportar sin alcanzar su punto de falla, asegurando que los materiales y componentes puedan resistir estas condiciones extremas durante su vida útil prevista.

La importancia de la verificación de E.L.U radica en su capacidad para prevenir desastres y asegurar la integridad estructural bajo condiciones críticas. Al identificar y evaluar los posibles modos de falla, se puede asegurar que la estructura no solo cumpla con los requisitos de resistencia, sino que también exista un margen de seguridad adecuado. Esto es esencial para proteger vidas humanas, minimizar daños materiales y asegurar la funcionalidad continua de las infraestructuras, especialmente en situaciones de carga máxima como: vientos extremos y otras condiciones severas.

2.2.4. Verificación de la aptitud al servicio (E.L.S)

La verificación de Estados Límite de Servicio (E.L.S) es un proceso de evaluación que asegura que una estructura funcione adecuadamente bajo condiciones de uso normales, sin presentar deformaciones excesivas, vibraciones, grietas o daños que puedan afectar su rendimiento o la comodidad de los usuarios.

Las combinaciones de carga utilizados para evaluar los E.L.S se centran en mantener la funcionalidad y el confort durante la vida útil del edificio o infraestructura. Este análisis incluye la consideración de factores como, la deflexión,

la vibración, etc. asegurando que la estructura se mantenga dentro de los límites aceptables de rendimiento y apariencia, y comodidad.

Una estructura que cumple con los requisitos de E.L.S proporciona un entorno confortable y seguro para los ocupantes, evitando problemas que puedan afectar su uso diario, como puertas y ventanas que no cierran correctamente, superficies irregulares, ruidos y vibraciones molestas o percepción de inseguridad. Además, la verificación de E.L.S contribuye a la durabilidad y sostenibilidad de la estructura, previniendo daños a largo plazo y reduciendo la necesidad de reparaciones costosas y disruptivas.

En este caso concreto, una estructura dimensionada y construida de acuerdo con las reglas de normas antiguas, se podrá considerar apta para el servicio siempre y cuando se cumpla:

- La estructura se haya comportado satisfactoriamente durante un período de tiempo largo sin daños ni anomalías ni deformaciones o vibraciones excesivas.
- Una inspección detallada no revela desplazamientos o vibraciones excesivas.
- Durante el período de servicio restante no se prevén cambios que alteren a su durabilidad.

3. Caracterización del modelo estructural

Para la creación del modelo estructural se tomó en consideración la documentación aportada por el promotor y se contrasto con la observada en visitas a la edificación y fotos.

Las acciones consideradas para el cálculo del modelo fueron calculadas aplicando la normativa pertinente (DB SE-AE).

3.1. Acciones consideradas

Para la comprobación de capacidad portante de la edificación se han tenido en cuenta acciones permanentes y variables, entre las cuales se encuentran las siguientes:

3.1.1. Carga muerta estructural (Peso propio)

El peso propio de los elementos estructurales es tenido en cuenta directamente por el software de cálculo al introducir los mismos, este depende del área de las secciones utilizadas y el tipo de acero.

En este caso particular no se modelar directamente la cubierta, optando alternativamente por reemplazar las acciones producidas por esta con una carga uniformemente distribuida de 0.39 KN/m^2, teniendo en cuenta la memoria de cálculo realizada al intervenir la misma para su cambio en 2006.

1. Chapa base

Chapa perfilada de acero galvanizado, pretratada y lacada con poliester de alta durabilidad en color RAL 9006, de largo teórico 10,10 metros, para salvar dos vanos de 5 metros cada uno entre cerchas con tres puntos de apoyo.

Formación de cubierta Pabellón de Cristal Material Peso (kg/m2)

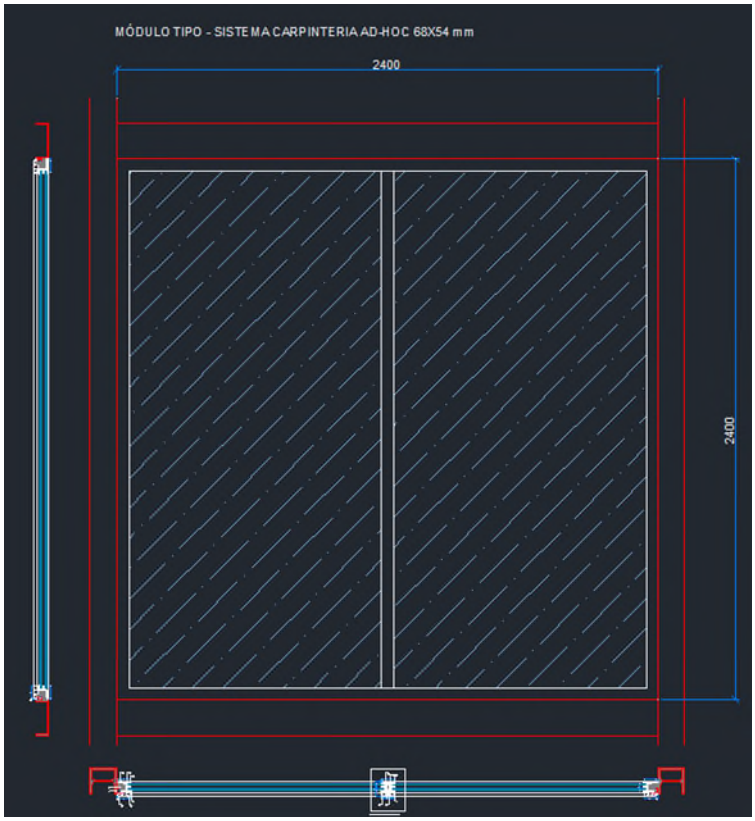
Chapa base grecada (acero perfilado lacada)	15,00
Barrera de Vapor (lámina autoadhesiva bituminosa reforzada con poliester)	1,50
Lana de Roca alta densidad 150kg/m3 (espesor 100mm)	15,00
Lana de Roca comprimible 30kg/m3 (espesor 80mm-60mm)	2,40
Perfiles soporte clips	1,50
Bandejas de aluminio espesor 1mm	4,00

Peso Total /m2 39,4 kg

3.1.2. Carga muerta no estructural

La carga muerta no estructural a tener en cuenta corresponde a los cerramientos y elementos separadores, tabiquería, revestimientos, rellenos, elementos fijos y todo tipo de carpintería.

Generalmente el valor característico de estos elementos constructivos se determina como su valor medio obtenido a partir de sus dimensiones nominales y pesos específicos. Estos últimos pueden encontrarse en el anejo C del documento básico de SE-AE, donde se incluyen pesos de materiales, elementos constructivos típicos y productos.



A partir de la tabla C.1 del Anejo C, tomamos el valor del vidrio: 25 KN/m^3

Tabla C.1 Peso específico aparente de materiales de construcción

Materiales y elementos	Peso específico aparente kN/m³	Materiales y elementos	Peso específico aparente kN/m³
Materiales de albañilería		**Madera**	
Arenisca	21,0 a 27,0	Aserrada, tipos C14 a C40	3,5 a 5,0
Basalto	27,0 a 31,0	Laminada encolada	3,7 a 4,4
Calizas compactas, mármoles	28,0	Tablero contrachapado	5,0
Diorita, gneis	30,0	Tablero cartón gris	8,0
Granito	27,0 a 30,0	Aglomerado con cemento	12,0
Sienita, diorita, pórfido	28,0	Tablero de fibras	8,0 a 10,0
Terracota compacta	21,0 a 27,0	Tablero ligero	4,0
Fábricas		**Metales**	
Bloque hueco de cemento	13,o a 16,0	Acero	77,0 a 78,5
Bloque hueco de yeso	10,0	Aluminio	27,0
Ladrillo cerámico macizo	18,0	Bronce	83,0 a 85,0
Ladrillo cerámico perforado	15,0	Cobre	87,0 a 89,0
Ladrillo cerámico hueco	12,0	Estaño	74,0
Ladrillo silicocalcáreo	20,0	Hierro colado	71,0 a 72,5
Mampostería con mortero		Hierro forjado	76,0
de arenisca	24,0	Latón	83,0 a 85,0
de basalto	27,0	Plomo	112,0 a 114,0
de caliza compacta	26,0	Zinc	71,0 a 72,0
de granito	26,0	**Plásticos y orgánicos**	
Sillería		Caucho en plancha	17,0
de arenisca	26,0	Lámina acrílica	12,0
de arenisca o caliza porosas	24,0	Linóleo en plancha	12,0
de basalto	30,0	Mástico en plancha	21,0
de caliza compacta o mármol	28,0	Poliestireno expandido	0,3
de granito	28,0	**Otros**	
Hormigones y morteros		Adobe	16,0
Hormigón ligero	9,0 a 20,0	Asfalto	24,0
Hormigón normal [1]	24,0	Baldosa cerámica	18,0
Hormigón pesado	> 28,0	Baldosa de gres	19,0
Mortero de cemento	19,0 a 23,0	Papel	11,0
Mortero de yeso	12,0 a 28,0	Pizarra	29,0
Mortero de cemento y cal	18,0 a 20,0	Vidrio	25,0
Mortero de cal	12,0 a 18,0		

[1] En hormigón armado con armados usuales o fresco aumenta 1 kN/m³

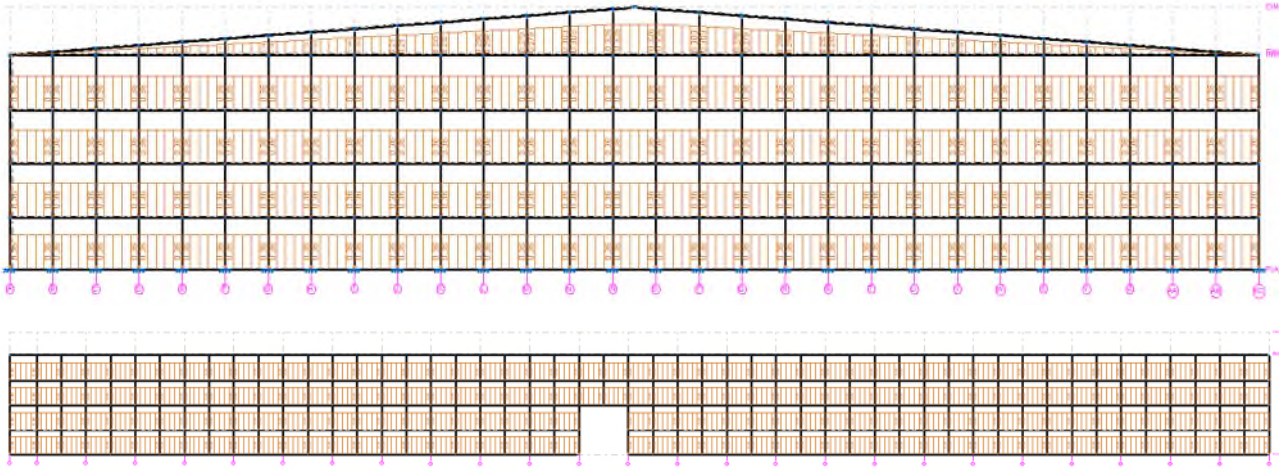
Y teniendo en cuenta la altura y espesor de la carpintería de ventanas se calcula el área vertical por metro.

Características de carpintería:

Altura: 2.4 m

Espesor: 60 mm

Calculo carga muerta:



Área vertical de carpintería

$$2.4\ m * 0.06\ m = 0.144\ m^2$$

Peso por metro lineal

$$0.144\ m^2 * 2500 \frac{Kg}{m^3} = 360\ Kg/m$$

Esta carga es aplicada* sobre las vigas perimetrales que sostienen la carpintería en la edificación.

*La carga es aplicada en unidades de Ton/m

3.1.3. Sobrecarga de uso

La sobrecarga de uso corresponde al peso de todo lo que pueda cargar el edificio por razón de su uso, para su definición se puede apoyar de la tabla 3.1 de valores característicos del documento básico de SE-AE. En este caso, se utiliza para considerar la carga sobre la cubierta del edificio, la cual al tener una inclinación menor a 20° es tomada como G1 y su carga uniforme corresponde a 1 KN/m^2.

Tabla 3.1. Valores característicos de las sobrecargas de uso

Categoría de uso		Subcategorías de uso		Carga uniforme [kN/m^2]	Carga concentrada [kN]
A	Zonas residenciales	A1	Viviendas y zonas de habitaciones en, hospitales y hoteles	2	2
		A2	Trasteros	3	2
B	Zonas administrativas			2	2
C	Zonas de acceso al público (con la excepción de las superficies pertenecientes a las categorías A, B, y D)	C1	Zonas con mesas y sillas	3	4
		C2	Zonas con asientos fijos	4	4
		C3	Zonas sin obstáculos que impidan el libre movimiento de las personas como vestíbulos de edificios públicos, administrativos, hoteles; salas de exposición en museos; etc.	5	4
		C4	Zonas destinadas a gimnasio u actividades físicas	5	7
		C5	Zonas de aglomeración (salas de conciertos, estadios, etc)	5	4
D	Zonas comerciales	D1	Locales comerciales	5	4
		D2	Supermercados, hipermercados o grandes superficies	5	7
E	Zonas de tráfico y de aparcamiento para vehículos ligeros (peso total < 30 kN)			2	20 [1]
F	Cubiertas transitables accesibles sólo privadamente [2]			1	2
G	Cubiertas accesibles únicamente para conservación [3]	G1 [7]	Cubiertas con inclinación inferior a 20°	1 [4] [6]	2
			Cubiertas ligeras sobre correas (sin forjado) [5]	0,4 [4]	1
		G2	Cubiertas con inclinación superior a 40°	0	2

3.1.4. Carga de nieve

La distribución y la intensidad de la carga de nieve en un edificio, particularmente en su cubierta, están influenciadas por el clima de la zona, el tipo de precipitación, la topografía del entorno, la forma del edificio o la cubierta, los efectos del viento y los intercambios térmicos en las superficies exteriores.

Según el Documento básico de SE-AE el valor de carga de nieve por unidad de superficie en proyección horizontal puede expresarse como:

$$q_n = \mu * s_k$$

Donde:

s_k es el valor característico de la carga de nieve según el terreno horizontal (Tabla 3.8 de DB SE-AE)

μ es el coeficiente de forma de la cubierta (3.5.3 de DB SE-AE)

Valor característico carga de nieve (s_k)

Teniendo en cuenta la ubicación del proyecto se define s_k = 0.6 KN/m^2.

Tabla 3.8 Sobrecarga de nieve en capitales de provincia y ciudades autónomas

Capital	Altitud m	s_k kN/m^2	Capital	Altitud m	s_k kN/m^2	Capital	Altitud m	s_k kN/m^2

						Ceuta y Melilla		

Coeficiente de forma de la cubierta (μ)

Debido a las características de la cubierta y su inclinación menor a 30º, teniendo en cuenta la sección 3.5.3 de DB SE-AE se define μ = 1.

Finalmente aplicando la ecuación inicial obtenemos una carga de nieve q_n = 0.6 KN/m^2.

3.1.5. Carga de viento

La distribución y la magnitud de las presiones ejercidas por el viento sobre un edificio, así como las fuerzas resultantes, dependen de la forma y dimensiones de la construcción, de las características y permeabilidad de su superficie, y de la dirección, intensidad y ráfagas del viento.

Según capítulo 3.3 del Documento básico de SE-AE la acción de viento o presión estática, puede expresarse como:

$$q_e = q_b * c_e * c_p$$

Donde:

q_b es la presión dinámica del viento.

c_e es el coeficiente de exposición.

c_p es el coeficiente eólico o de presión.

Presión dinámica del viento (q_b)

El valor básico de la presión dinámica del viento puede obtenerse con la expresión:

$$q_b = 0.5 * \delta * {v_b}^2$$

Donde:

δ es la densidad del aire.

v_b es el valor básico de la velocidad del viento

En el anejo D.1 de DB SE-AE se establece que puede adoptarse como valor general la densidad del aire como δ=1.25 Kg/m^3 y utilizando la figura D.1 establecemos a Madrid en la Zona A con una velocidad básica del viento v_b=26 m/s.

Esto da como resultado una presión dinámica q_b = 0.42 KN/m^2.

Coeficiente de exposición (c_e)

El coeficiente de exposición tiene en cuenta los efectos de las turbulencias originadas por el relieve y la topografía del terreno. Se obtiene su valor a partir de la siguiente expresión que se encuentra en el anejo D.2

$$c_e = F * (F + 7 * k)$$

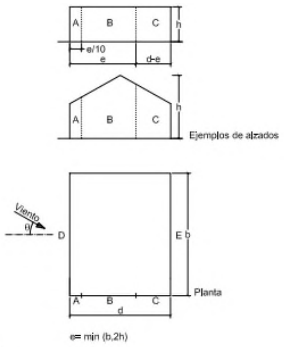
$$F = k \ln(\max(z, Z)/L)$$

Donde k, L, Z son parámetros característicos de cada tipo de entorno, según la tabla D.2.

Y z es la altura a evaluar.

Tabla D.2 Coeficientes para tipo de entorno

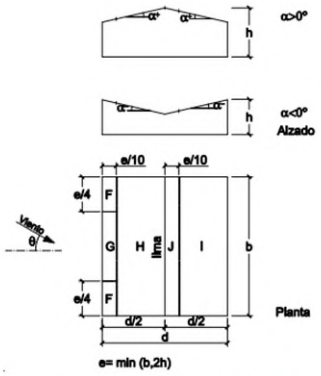
	Grado de aspereza del entorno	Parámetro k	L (m)	Z (m)
I	Borde del mar o de un lago, con una superficie de agua en la dirección del viento de al menos 5 km de longitud	0,156	0,003	1,0
II	Terreno rural llano sin obstáculos ni arbolado de importancia	0,17	0,01	1,0
III	Zona rural accidentada o llana con algunos obstáculos aislados, como árboles o construcciones pequeñas	0,19	0,05	2,0
IV	Zona urbana en general, industrial o forestal	0,22	0,3	5,0
V	Centro de negocios de grandes ciudades, con profusión de edificios en altura	0,24	1,0	10,0



Para este caso particular se ha establecido un grado de aspereza del entorno tipo IV.

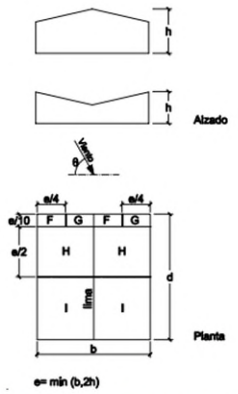
Coeficiente eólico o de presión (c_p)

Este coeficiente depende de la forma del edificio y la orientación de la superficie respecto al viento, la posición del elemento considerado, y su área de influencia.



Se utiliza la tabla D.3 del anejo D de DB SE-AE para definir estos coeficientes según los parámetros a considerar.

En el caso de los parámetros verticales se deberá tener en cuenta la siguiente tabla:



A (m^2)	h/d	Zona (según figura), $-45° < \theta < 45°$ A	B	C	D	E
≥ 10	5	-1,2	-0,8	-0,5	0,8	-0,7
	1	"	"	"	"	-0,5
	≤ 0,25	"	"		0,7	-0,3
5	5	-1,3	-0,9	-0,5	0,9	-0,7
	1	"	"	"	"	-0,5
	≤ 0,25	"	"	"	0,8	-0,3
2	5	-1,3	-1,0	-0,5	0,9	-0,7
	1	"	"	"	"	-0,5

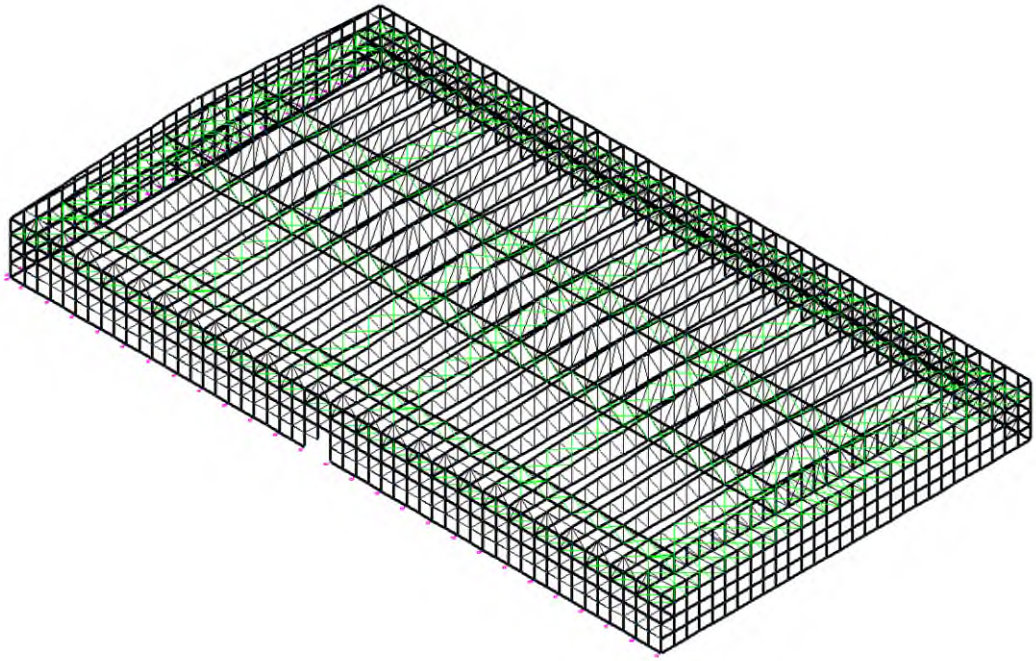
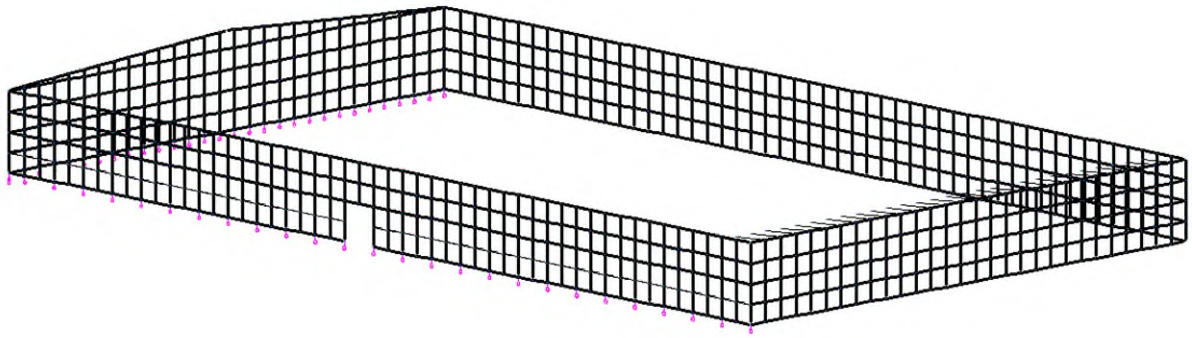
5°	≥ 10	-1,6	-1,3	-0,7	-0,6
	≤ 1	-2,2	-2,0	-1,2	-0,6
15°	≥ 10	-1,3	-1,3	-0,6	-0,5
	≤ 1	-2,0	-2,0	-1,2	-0,5
30°	≥ 10	-1,1	-1,4	-0,8	-0,5
	≤ 1	-1,5	-2,0	-1,2	-0,5
45°	≥ 10	-1,1	-1,4	-0,9	-0,5
	≤ 1	-1,5	-2,0	-1,2	-0,5
60°	≥ 10	-1,1	-1,2	-0,8	-0,5
	≤ 1	-1,5	-2,0	-1,0	-0,5
75°	≥ 10	-1,1	-1,2	-0,8	-0,5
	≤ 1	-1,5	-2,0	-1,0	-0,5

Teniendo en cuenta estos parámetros base, se utilizó el software portal frame generator de CYPE para crear las cargas de viento e introducirlas en el modelo.



3.2. Modelado de la estructura

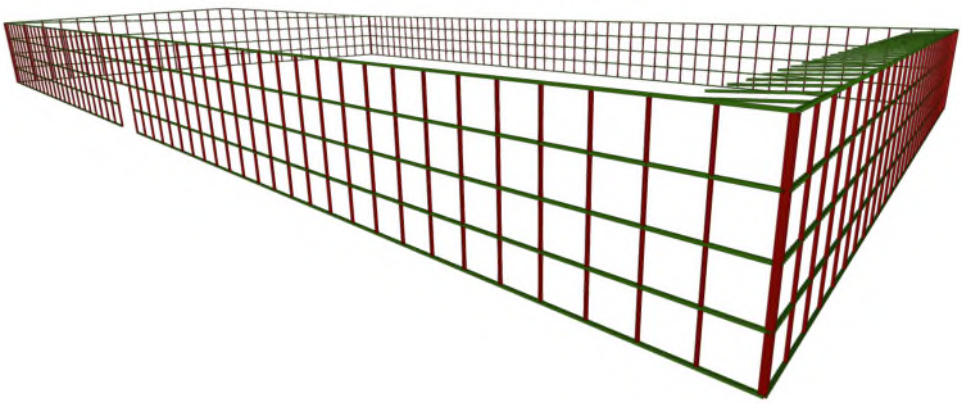
Con el objetivo de recrear lo más fielmente posible el comportamiento estructural de la edificación, se modela toda la estructura interna de cerchas con sus tensores correspondiente, ya que estos aportan rigidez a la estructura perimetral externa que será evaluada.



Para el modelado de la estructura se utilizó el programa CYPE v.2024.

3.2.1. Geometría del modelo

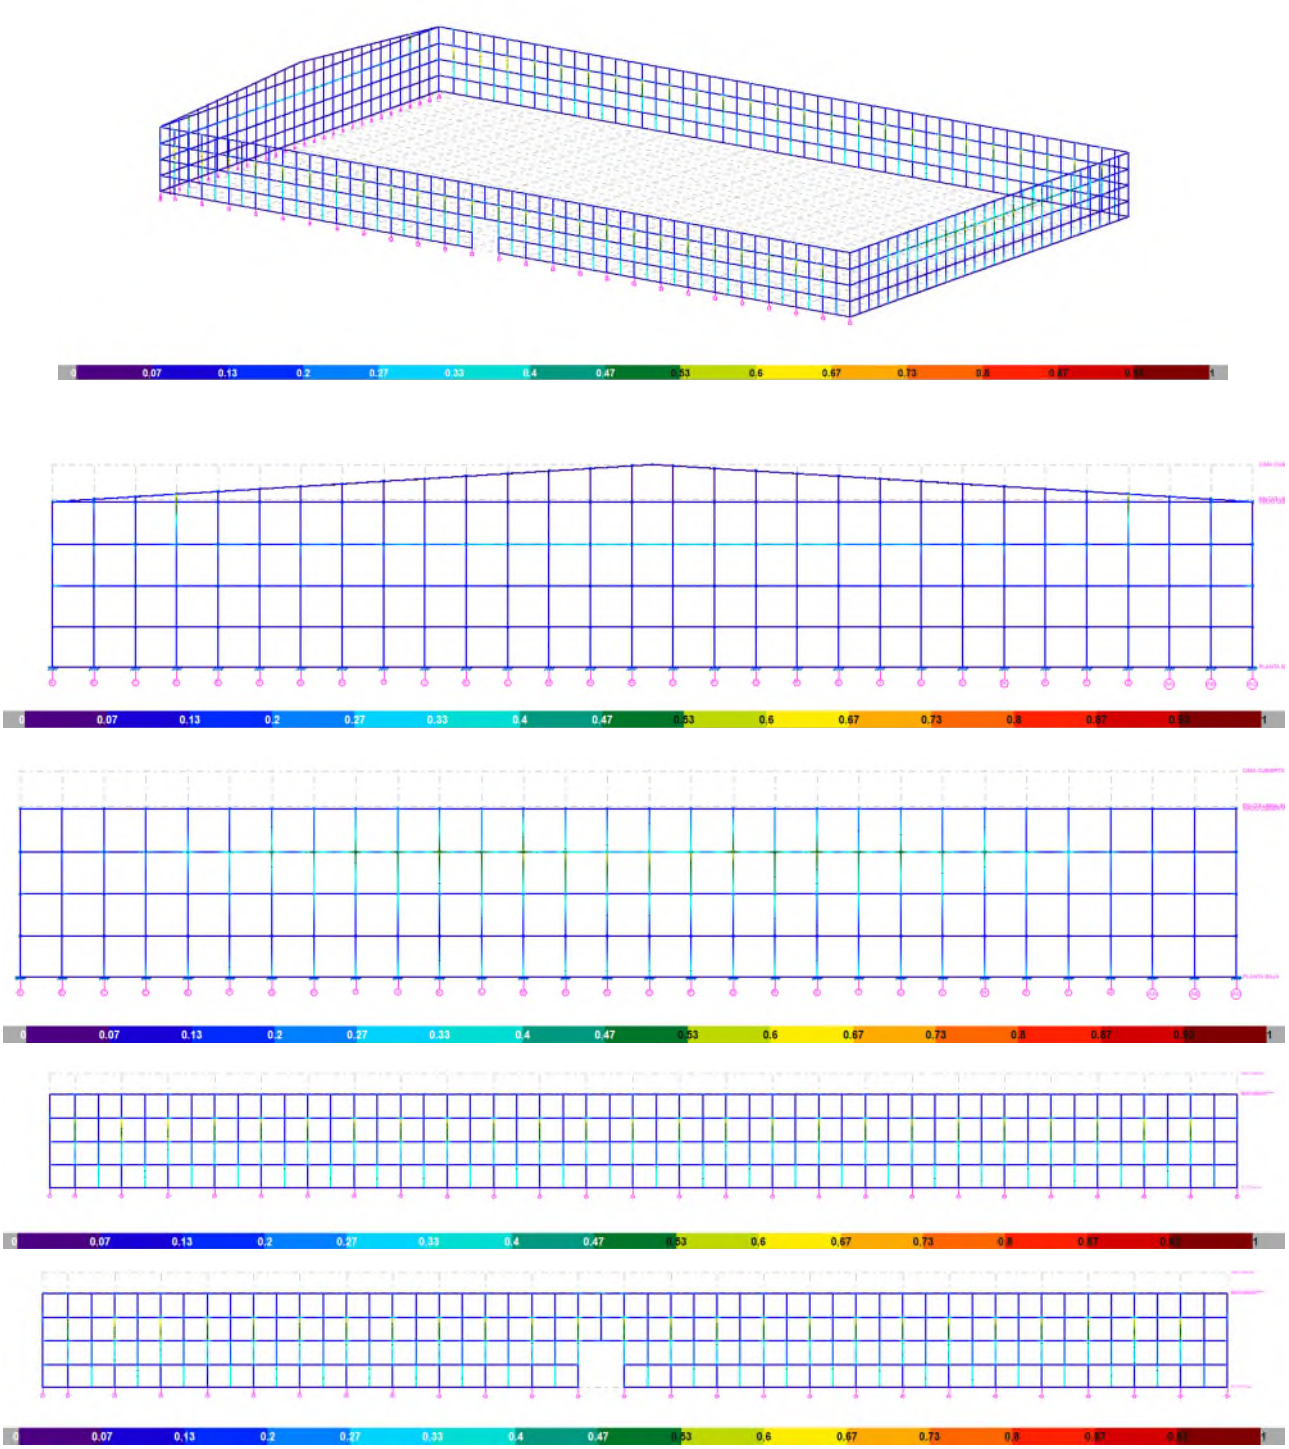
Teniendo en cuenta la documentación aportada que consistía en memorias de rehabilitación, planos, etc. Se modela la estructura general.



Una vez modelada se puede discretizar los elementos de la estructura externa e interna para tener una mejor vista de los elementos a evaluar.

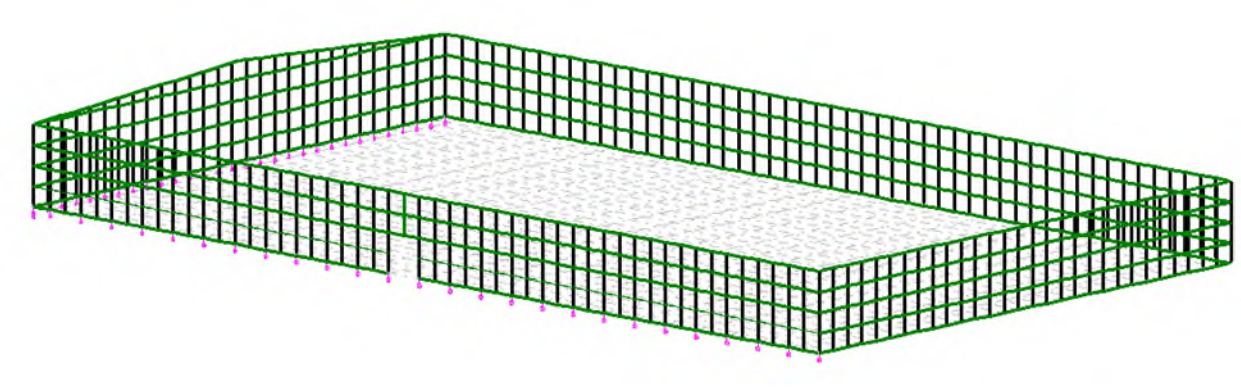
3.2.2. Definición de secciones

Vista 3D de la estructura interna y sus secciones.



3.3. Resultados de calculo

Una vez introducidas las secciones y cargas a considerar se ejecuta el modelo y evalúa la capacidad portante del mismo (E.L.U) y su capacidad de servicio. (E.L.S)



3.3.1. Comprobación de elementos E.L.U (tensión/aprovechamiento)

En las siguientes figuras se aprecia una escala de 0 a 1.0 donde se indica el aprovechamiento de cada elemento estructural, es decir, a que porcentaje de su capacidad máxima está trabajando.

3.3.2. Comprobación de elementos (E.L.S)

Se estableció una flecha máxima de L/300 para todos los elementos de la estructura, en la siguiente figura se presenta como todos cumplen este parámetro al estar iluminados de verde.

3.3.3. Tablas de resultados de análisis

En el Anejo 1 se presenta la memoria de calculo generada por el software utilizado, en esta se evidencian las combinaciones de carga utilizadas en el modelo y las comprobaciones por estados limites de cada elemento estructural del edificio analizado.

4. Conclusiones del estudio

Al realizar un análisis de resultados del modelo estructural se puede apreciar que los elementos perimetrales de la estructura se encuentran trabajando en promedio a un 38% de su capacidad portante, es decir, no presentan problemas para soportar las acciones que afectan la estructura ni la carga adicional que representa la nueva carpintería de ventanas.

Sumado a esto, las deformaciones máximas no superan el 45% en toda la estructura, indicando así que tiene un buen comportamiento y no presentara incomodidades para presentar el servicio al que fueron diseñados los elementos.

Teniendo en cuenta lo anterior, se establece que la estructura externa del Pabellón de Cristal presenta un correcto comportamiento frente a las cargas adicionales incurridas por el cambio de carpintería.

1.3. Resultados

1.3.1. Barras

1.3.1.1. Flechas

Referencias:

Pos.: Valor de la coordenada sobre el eje 'X' local del grupo de flecha en el punto donde se produce el valor pésimo de la flecha.
L.: Distancia entre dos puntos de corte consecutivos de la deformada con la recta que une los nudos extremos del grupo de flecha.

Notación: *l_w: Abolladura del alma inducida por el ala comprimida* *N_t: Resistencia a tracción* *N_c: Resistencia a compresión* *M_Y: Resistencia a flexión eje Y* *M_Z: Resistencia a flexión eje Z* *V_Z: Resistencia a corte Z* *V_Y: Resistencia a corte Y* *M_YV_Z: Resistencia a momento flector Y y fuerza cortante Z combinados* *M_ZV_Y: Resistencia a momento flector Z y fuerza cortante Y combinados* *NM_YM_Z: Resistencia a flexión y axil combinados* *$NM_YM_ZV_YV_Z$: Resistencia a flexión, axil y cortante combinados* *M_t: Resistencia a torsión* *M_tV_Z: Resistencia a cortante Z y momento torsor combinados* *M_tV_Y: Resistencia a cortante Y y momento torsor combinados* *x: Distancia al origen de la barra* *h: Coeficiente de aprovechamiento (%)* *N.P.: No procede*
Comprobaciones que no proceden (N.P.): *(1) No hay interacción entre momento flector y esfuerzo cortante para ninguna combinación. Por lo tanto, la comprobación no procede.* *(2) La comprobación no procede, ya que no hay momento torsor.* *(3) La comprobación no procede, ya que no hay axil de compresión.* *(4) La comprobación no procede, ya que no hay axil de tracción.* *(5) La comprobación no procede, ya que no hay momento flector que comprima un ala, de forma que se pueda desarrollar el fenómeno de abolladura del alma inducida por el ala comprimida.* *(6) La comprobación no procede, ya que no hay momento flector.* *(7) La comprobación no procede, ya que no hay esfuerzo cortante.* *(8) No hay interacción entre axil y momento flector ni entre momentos flectores en ambas direcciones para ninguna combinación. Por lo tanto, la comprobación no procede.* *(9) No hay interacción entre momento flector, axil y cortante para ninguna combinación. Por lo tanto, la comprobación no procede.* *(10) No hay interacción entre momento torsor y esfuerzo cortante para ninguna combinación. Por lo tanto, la comprobación no procede.*
Errores: *(1) El axil de compresión es excesivo y supera los axiles críticos de pandeo.* *(2) El axil de compresión es excesivo y supera el axil resistente plástico.* *(3) El axil de tracción es excesivo y supera el axil resistente plástico.*

1.3.2. Pilares

1.3.2.1. Comprobaciones E.L.U. y E.L.S.

En las tablas de comprobación de pilares de acero no se muestran las comprobaciones con coeficiente de aprovechamiento inferior al 10%.

λ_w: Abolladura del alma inducida por el ala comprimida

N_t: Resistencia a tracción

N_c: Resistencia a compresión

M_Y: Resistencia a flexión eje Y

M_Z: Resistencia a flexión eje Z
V_Y: Resistencia a corte Y
NM_YM_Z: Resistencia a flexión y axil combinados
M_tV_Y: Resistencia a cortante Y y momento torsor combinados
V_Z: Resistencia a corte Z
M_tV_Z: Resistencia a cortante Z y momento torsor combinados
M_t: Resistencia a torsión

Notas:

[1] La comprobación no procede, ya que no hay axil de tracción.
[2] La comprobación no procede, ya que no hay momento torsor.
[3] No hay interacción entre momento torsor y esfuerzo cortante para ninguna combinación. Por lo tanto, la comprobación no procede.

ÍNDICE

1. MEMORIA DESCRIPTIVA 4
1.1. CONTEXTO GENERAL 4
1.2. AGENTES 5
1.2.1. Datos del solicitante 5
1.2.2. Otros agentes 5
1.3. INFORMACIÓN PREVIA 6
1.3.1. Emplazamiento 6
1.3.2. Condiciones urbanísticas 8
1.3.3. Tipo de obra 10
1.4. OBJETIVOS DEL C11.I4 DEL PLAN DE RECUPERACIÓN, TRANSFORMACIÓN Y RESILIENCIA 11
1.5. DESCRIPCIÓN GENERAL Y DEL ESTADO ACTUAL 12
1.6. DESCRIPCIÓN GENERAL DE LAS OBRAS A ACOMETER 25
1.6.1. Descripción de acceso y evacuación 25
1.6.2. Localización de los servicios urbanos existentes o por establecer 25
1.7. PRESTACIONES DEL INMUEBLE 25
1.7.1. Limitaciones de uso 29
1.7.2. Prestaciones que superan los umbrales establecidos en el CTE 29
2. MEMORIA CONSTRUCTIVA 30
2.1. DESCRIPCIÓN DETALLADA DE LA SOLUCIÓN PROPUESTA 30
2.1.1. Demoliciones y desmontajes. 30
2.1.2. Instalación de climatización/ventilación 30
2.1.3. Justificación de la solución adoptada 30
2.1.4. Planificación de la actuación 31
2.1.5. Criterios de intervención 31
3. CUMPLIMIENTO DE LA NORMATIVA VIGENTE 32
3.1. CUMPLIMIENTO DEL CTE 32
3.1.1. Seguridad estructural (DB-SE) 32
3.1.2. Seguridad en caso de incendio (DB-SI) 32
3.1.3. Seguridad de utilización y accesibilidad (DB-SUA) 35
3.1.4. Ahorro de energía (DB-HE) 35

3.1.5. Protección frente al ruido (DB HR) 38
3.1.6. Salubridad (DB-HS) 39
3.2. CUMPLIMIENTO DE OTROS REGLAMENTOS Y DISPOSICIONES 40
4. MEMORIA ADMINISTRATIVA 41
4.1. DECLARACIÓN DE OBRA COMPLETA 41
4.2. CLASIFICACIÓN DEL TIPO DE OBRA. CLASIFICACIÓN DEL CONTRATISTA 42
4.2.1. Clasificación del tipo de obra 42
4.2.2. Propuesta de clasificación del contratista. 42
4.3. FORMA DE ADJUDICACIÓN DE LOS CONTRATOS DE OBRAS 45
4.4. PLAZO DE EJECUCIÓN DE LAS OBRAS 45
4.5. PLAZO DE GARANTÍA 45

1. MEMORIA DESCRIPTIVA

1.1. CONTEXTO GENERAL

Por encargo de La Sociedad Mercantil Municipal MADRID DESTINO CULTURA TURISMO Y NEGOCIO S.A., en adelante MADRID DESTINO se dispone a llevar a cabo parte de las actuaciones a las que se refiere la componente 14, inversión 1 del Plan de Recuperación, transformación y resiliencia, en adelante PRTR, financiado por los Fondos de la Unión Europea - Next GenerationEU.

La inversión 1 tiene por objeto implementar actuaciones de impulso de la sostenibilidad turística en su triple vertiente: medioambiental, socioeconómica y territorial; beneficiando a los destinos turísticos, a los agentes sociales y a los operadores privados del sector. Entre otras, se recogen los siguientes ejes y medidas:

- Eje 1: Actuaciones en el ámbito de la transición verde y sostenible: comprende actuaciones de restauración ambiental, gestión de espacios naturales, acciones de implantación de economía circular, rehabilitación sostenible de edificios y actuaciones de adaptación al cambio climático:

  - Restauración ambiental
  - Adaptación al cambio climático del destino y sus infraestructuras, previo análisis de los riesgos climáticos del destino y sus infraestructuras bajo los diferentes escenarios de cambio climático.
  - Implantación de medidas de economía circular en servicios públicos
  - Gestión del uso público en espacios naturales

- Eje 2: Actuaciones de mejora de la eficiencia energética: comprende actuaciones de eficiencia energética incluyendo las de mitigación del cambio climático, actuaciones orientadas a la reducción de la energía requerida para proporcionar productos y servicios turísticos, limitando la contaminación por carbono y estimulando la transición hacia energías renovables, así como actuaciones de movilidad sostenible:

  - Mitigación del cambio climático
  - Descarbonización
  - Movilidad sostenible

Los dos objetivos prioritarios del mencionado PRTR son:

- Al menos un salto de letra en la certificación energética
- Un ahorro mínimo del 30 % de energía primaria en sistemas afectados

El presente estudio ha sido financiado a través del contrato con EXPEDIENTE Nº SP23-00586 relativo al LOTE 2 suscrito por CEMOSA para la prestación de los SERVICIOS DE ASISTENCIA TÉCNICA ESPECIALIZADA EN MATERIA DE CONSULTORÍA DE DESARROLLO DE EVALUACIONES DE IMPACTO AMBIENTAL, CERTIFICACIONES ENERGÉTICAS, REDACCIÓN DE PROYECTO Y ESTUDIO DE ESTRUCTURA DE FACHADA PARA EL PABELLÓN DE CRISTAL DE LA CASA DE CAMPO, en el marco del Plan De Recuperación, Transformación y Resiliencia financiado por la Unión Europea -Next Generation EU. lote 2.

Para la realización de estos trabajos, en el informe previo se proponen una serie de actuaciones necesarias para alcanzar una reducción del 30% de energía primaria no renovable, prestando especial interés al principio de no causar daños significativos (DNSH) que establece pautas para el análisis de riesgo en relación con posibles impactos negativos en el medio ambiente, mecanismos de prevención, detección y corrección del fraude, corrupción y conflictos de interés.

1.2. AGENTES

1.2.1. Datos del solicitante

La Sociedad Mercantil MADRID DESTINO CULTURA TURISMO Y NEGOCIO, S.A., es una sociedad mercantil pública municipal que pertenece al AYUNTAMIENTO DE MADRID, con domicilio social en el Centro Cultural Conde Duque. Calle Conde Duque 9-11, 28015 (Madrid), CIF: A-84073105 e Inscripción

1.2.2. Otros agentes

Proyectista/s

Nombre:	D. José Moriana Pericet

Por designar

1.3. INFORMACIÓN PREVIA

En el siguiente apartado se describen las condiciones del emplazamiento del edificio, así como sus condicionantes a nivel urbanísticos y una breve descripción de los trabajos a llevar a cabo en este proyecto derivados del estudio realizado sobre el edificio en el Informe Previo.

1.3.1. Emplazamiento

El Pabellón de Cristal se encuentra situado en la Avenida Principal, 16, sito en el distrito de Moncloa – Aravaca en la ciudad de Madrid (28011), en una parcela de 18.678 m^2 de superficie en suelo urbano según se indica en la ficha catastral de referencia 7541208VK3774B0001QY y de uso “Ocio, Hostelería”.

Figura 1. Vista aérea del edificio

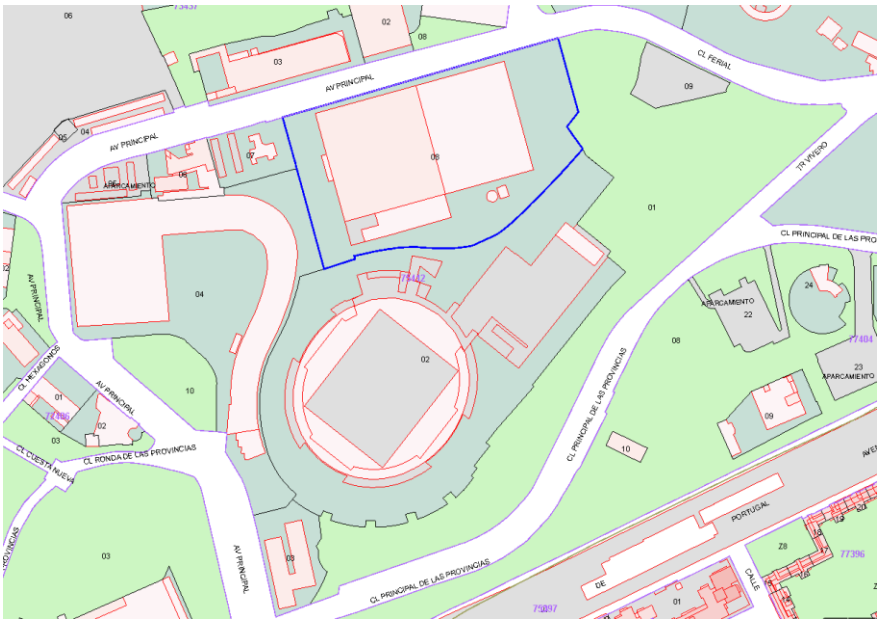

Figura 2. Parcela catastral

La parcela se encuentra urbanizada con vallado presente en parte de su perímetro para control de acceso al edificio. Cuenta con acceso de vehículos, vial rodado, aparcamientos y acerados.

1.3.2. Condiciones urbanísticas

Condiciones urbanísticas

- Área de Ordenación Especial. AOE 00.04
- Distrito 09 Moncloa-Aravaca (Casa de Campo)
- Uso y tipología característica: Dotacional. Servicios colectivos. Público

Condiciones de catalogación

- Catalogación: Singular
- Conjunto Homogéneo: Casa de Campo
- La Casa de Campo está declarada Bien de Interés Cultural en su categoría de Sitio o Territorio Histórico según Real Decreto 39/2010, de 15 de julio, del Consejo de Gobierno, (B.O.C.M. Núm. 275 de 17 noviembre 2010).

FICHA DE CONDICIONES URBANÍSTICAS

Este documento no sustituye a la Cédula Urbanística contemplada en la Ley del Suelo ya que sólamente resume, a efectos informáticos y sin carácter vinculante, las disposiciones que sobre la finca de referencia establece el nuevo P.G.O.U.M., obtenidas de la documentación aprobada por el Ayuntamiento Pleno en sesión de 17 de diciembre de 1996.
Son obligatorias las condiciones específicas de planeamiento y las especiales de catalogación, conforme a lo regulado en los artículos 4.3.3. y 4.3.18 de las normas Urbanísticas.

IDENTIFICACIÓN DE LA PARCELA

Nombre: -
Nº de Catálogo: 28764
Dirección principal: EDIFICIOS PABELLÓN DE CRISTAL -

19
Avenida Principal
16

Escala: 1:1000
Hoja Plan General: 072/3 (559/3-5/3)
Hoja-Cuarto Plano Parcelario: 74C

CONDICIONES DE CATALOGACIÓN

Catalogación: Singular
Protecciones en otros Catálogos:
Establecimientos comerciales:
Elementos singulares:
Parques y Jardines:
Conjunto Homogéneo: --

Figura 3. Ficha urbanística

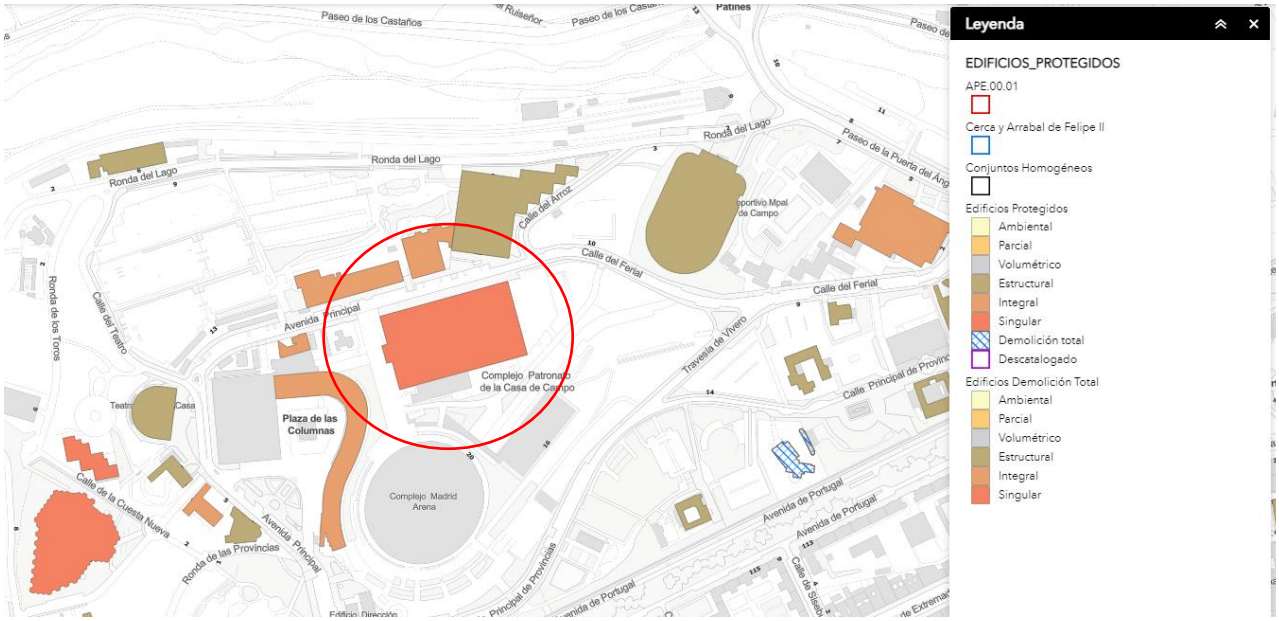

Figura 4. Edificios protegidos

A nivel urbanístico, tras realizar la consulta de documentación correspondiente se comprueba que el edificio tiene la catalogación de edificio singular, no obstante, las actuaciones previstas a llevar a cabo objeto de este proyecto no modifican la imagen exterior del edificio ni alteran su relación con el entorno . Así mismo, al no alterar en ninguna medida el contorno construido, la intervención en el edificio no conllevará un aumento de superficies.

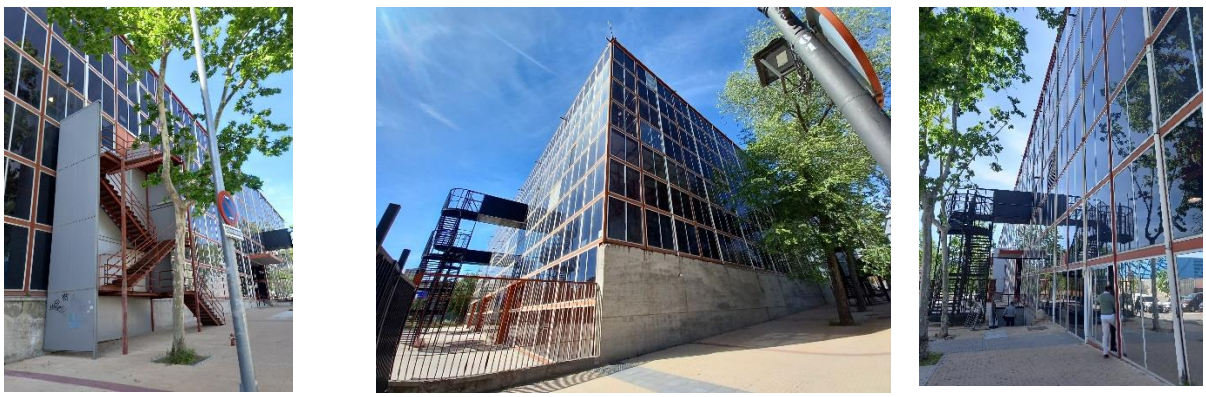

Figura 5. Urbanización de parcela

1.3.3. Tipo de obra

Nueva construcción	NO	Ampliación	NO	Adecuación estructuras	NO
Cambio de uso característico	NO	Modificación	NO	Adecuación funcional	SI
Sencillez técnica en planta única	NO	Reforma	SI	Remodelación (uso residencial)	NO
		Edificio protegido	SI	Rehabilitación integral	NO

¿El grado de intervención, incluye intervenciones en la estructura existente de la edificación? (Art. 17.1.a LOE)	NO

La clasificación de los edificios y sus zonas se realiza atendiendo a lo dispuesto en el artículo 2 de la LOE, si bien, en determinados casos, en los Documentos Básicos del CTE se podrán clasificar los edificios y sus dependencias de acuerdo con las características específicas de la actividad a la que vayan a dedicarse, con el fin de adecuar las exigencias básicas a los posibles riesgos asociados a dichas actividades. Cuando la actividad particular de un edificio o zona no se encuentre entre las clasificaciones previstas se adoptará, por analogía, una de las establecidas, o bien se realizará un estudio específico del riesgo asociado a esta actividad particular basándose en los factores y criterios de evaluación de riesgo siguientes:

- Las actividades previstas que los usuarios realicen;
- Las características de los usuarios;
- El número de personas que habitualmente los ocupan, visitan, usan o trabajan en ellos;
- La vulnerabilidad o la necesidad de una especial protección por motivos de edad, como niños o ancianos, por una discapacidad física, sensorial o psíquica u otras que puedan afectar su capacidad de tomar decisiones, salir del edificio sin ayuda de otros o tolerar situaciones adversas;
- La familiaridad con el edificio y sus medios de evacuación;
- El tiempo y período de uso habitual;
- Las características de los contenidos previstos;
- El riesgo admisible en situaciones extraordinarias; y
- El nivel de protección del edificio.

El proyecto describe y define las actuaciones con el detalle suficiente para que puedan valorarse e interpretarse inequívocamente y así obtener la correspondiente licencia para la ejecución de las obras. En base a las conclusiones del informe de Estudios Previos, se plantean una serie de trabajos en base a las Medidas de Ahorro Energético (MAEs) que se describen en el apartado siguiente.

En base a estas actuaciones, los trabajos necesarios para la consecución de estos objetivos conllevan tanto, el desmontaje y sustitución de elementos constructivos, como el desmontaje de las instalaciones actuales y

la realización de una nueva instalación adecuada a las necesidades y posibilidades tecnológicas actuales según se desarrolla a continuación en la memoria y en el resto de documentos del proyecto.

1.4. OBJETIVOS DEL C11.I4 DEL PLAN DE RECUPERACIÓN, TRANSFORMACIÓN Y RESILIENCIA

El PRTR tiene como objetivo promover el ahorro y la eficiencia energética y fomentar la utilización de energías de origen renovable en los edificios e infraestructuras, así como impulsar la movilidad sostenible.

Los proyectos deberán conseguir un ahorro mínimo de energía primaria del 30% mediante la realización de medidas de mejora de la eficiencia energética y la utilización de energías renovables. La verificación del ahorro de energía primaria y de la reducción de emisiones de CO_2 se realizará tanto ex ante como ex post, según los casos. Cuando se trate de edificios se comparará el certificado de eficiencia energética del edificio antes y después de la actuación, ya que es a través del cual se cuantifican los resultados energéticos obtenidos. Estos certificados están regulados por el Real Decreto 235/2013, de 5 de abril, y deben estar registrados en el órgano competente de la comunidad autónoma que también realiza su inspección y control, y serán emitidos por técnicos competentes.

Por tanto, para cada uno de los inmuebles o actuaciones, se deberá acreditar el cumplimiento del objetivo mediante las siguientes pruebas y elementos documentales:

- referencias oficiales de los certificados de eficiencia energética individuales antes y después de la renovación energética.
- superficie renovada energéticamente en m².
- el consumo de energía primaria en los certificados de eficiencia energética antes y después de la acción de renovación, el ahorro energético logrado.
- la reducción media ponderada del consumo de energía primaria no renovable (utilizando como ponderaciones los m² de renovación, kWh/m²).

Medidas de mejora de la eficiencia energética y la utilización de energías renovables.

En el caso de este edificio, se han planteado las siguientes medidas de mejora. Estas han sido presentadas previamente en el Informe Previo y se han propuesto en base al alcance del contrato y las necesidades detectadas en las diferentes visitas del edificio para dar una respuesta global a la mejora de la eficiencia energética del mismo. Las medidas consideradas, por tanto, son las siguientes:

1. MAE 1. Mejora de la envolvente térmica del edificio:

Esta medida de mejora estudia la sustitución de las carpinterías existentes por unas carpinterías de aluminio anodizado de alta calidad, con rotura de puente térmico, y un acristalamiento laminar estratificado, con cámara de control térmico, control solar y lámina de vidrio de seguridad. Se ha calculado la transmitancia térmica del marco y del vidrio en función de la descripción en la memoria y en planimetría:

- Vidrio doble bajo emisivo 4.4 + 16 (argón 90%)+ 4.4 con una transmitancia calculada de 1W/m^{2}K y un factor solar de 0,50

- Carpintería de aluminio anodizado de alta calidad, con rotura de puente térmico. Se valora una transmitancia de 4 W/m^{2}K.
- Permeabilidad total del hueco clase 3.

2. MAE 2. Mejora del sistema de climatización:

Esta medida de mejora estudia la renovación de los sistemas de climatización ubicados en el interior del pabellón. Con anterioridad se ha realizado la sustitución de los equipos de generación de agua caliente y agua fría para climatización. En esta medida se contempla la renovación de los sistemas de tratamiento de aire en la planta alta del edificio.

- Unidades de tratamiento de aire en planta alta con una eficiencia de recuperación de calor del 75% y capacidad free-cooling

3. CONJUNTO DE MEDIDAS DE AHORRO ENERGÉTICO (MAEs).

Esta medida de mejora estudia la implementación conjunta de las medidas de mejora propuestas, definidas anteriormente

Tipo de Mejora	Descripción de la actuación	Cto. CTE	Consumo EPNR (kWh/m^{2}año)	Calificación EPNR	Emisiones de CO_2 (kgCO_2/m^{2}año)	Calificación Emisiones	% Reducción EPNR
ESTADO ACTUAL	Evaluación actual del edificio.	-	180,54	E	42,14	E	-
CONJUNTO	MAE 1 + MAE 2	Sí	123,77	C	26,89	D	31,44

Como se puede apreciar, no se consigue satisfacer el objetivo únicamente con medidas de mejora de envolvente. La mejora de la calificación energética se consigue mediante la renovación conjunta de la envolvente térmica y los sistemas de climatización y ventilación.

El presente proyecto define las actuaciones necesarias a llevar a cabo para la renovación de los equipos de climatización y ventilación según la MAE 2 ya que las medidas previstas en la MAE 1 se redactan y definen en un proyecto paralelo.

1.5. DESCRIPCIÓN GENERAL Y DEL ESTADO ACTUAL

Descripción del edificio

El Pabellón de Cristal de la Casa de Campo de Madrid se proyecta para el uso ferial en el año 1964 por los arquitectos Francisco de Asís Cabrero, Jaime Ruiz y Luis Labiano y los ingenieros Rafael Heredia y Anselmo Moreno como parte de las edificaciones de la Feria del Campo, y construyéndose entre los años 1964-1965 en un plazo récord de 8 meses.

Los trabajos de construcción fueron ejecutados por la empresa Constructora Asturiana.

Ha mantenido su actividad ferial hasta la actualidad, perteneciendo a diferentes propiedades en el transcurso de los años, entre las que cabe mencionar el Patronato de la Feria del Campo, IFEMA y la empresa municipal

Campo de las Naciones, que manteniendo en esencia el espíritu inicial del edificio no han invertido los recursos necesarios para la conservación de un edificio sometido a un uso tan riguroso como el que nos ocupa.

La unión de los limitados recursos materiales del momento de construcción, junto con un comprometido plazo de ejecución hacen que, junto a la indiscutible calidad arquitectónica del edificio, y sus grandes aciertos de organización interna, haya detalles que se terminaran sin la calidad de ejecución suficiente, o incluso sin el mismo acierto espacial, debiendo comprometer algunas soluciones en los últimos días de ejecución de las obras.

Todos estos factores, junto con la escasez de dinero para el mantenimiento del edificio, hacen que tengamos un edificio relativamente bien conservado en cuanto a que no se han perdido las huellas del origen, pero al mismo tiempo, con grandes problemas en su estado físico que limitan en cierta manera el confort en el uso.

Si bien su superficie es diáfana en su mayoría, pues los contenidos interiores son variables con cada evento, al edificio corresponden las garantías de estanqueidad, acondicionamiento térmico, suministros básicos para la actividad interior y aquellos servicios mínimos para el desarrollo de las ferias, que, a fecha de hoy, se encuentran comprometidos.

Junto a estos, existen problemas de adecuación a las normativas vigentes, que en el momento de rehabilitación integral se deberán analizar y solucionar, siempre con el compromiso de conservación de las características espaciales y constructivas del edificio, que se encuentra catalogado por su especial valor arquitectónico, y en el cual las actuaciones deberán quedar consensuadas con la Comisión Institucional para la Protección del Patrimonio Histórico Artístico y Natural (CIPHAN).

Los trabajos de rehabilitación completa del Pabellón de Cristal se inician el año 2005 en el que se realizan las siguientes actuaciones:

Desmontaje de elementos añadidos en varias plantas

Renovación de los núcleos de aseos y vestuarios en planta alta, entreplanta y baja Revestimiento de paramentos en vestíbulo de acceso

Renovación de carpinterías y vidriería en vestíbulo de acceso

Sustitución de cafetería por vestuarios de personal en planta baja

Renovación del solado en planta alta

Durante el periodo estival del año 2006 se ha procedido a la sustitución de la cubierta del edificio de exposiciones que databa del año 1965 por una nueva cubierta realizada con bandejas continuas de aluminio prepatinado, material original de la cubierta del edificio.

En los años 2007 y 2008 se realizan obras consistentes en la construcción de un edificio industrial bajo rasante en el que se centralizan las salas de calderas, enfriadoras, grupo electrógeno, grupo de presión de incendios,

aljibe de incendios, centro de transformación y cuadro general de baja tensión, conectando con el edificio existente mediante una galería de módulos prefabricados enterrada.

Se demuele el salón de actos y el pasillo lateral del mismo, dejando libre de usos distintos del ferial la entreplanta del edificio, y se realiza la fontanería y electricidad en el interior de los pilares de hormigón, a los que se genera un nuevo acceso de registro mediante el adosamiento de un cajón metálico que permite el registro de las instalaciones y conexiones eléctricas en el interior de los pilares.

Se realiza un suelo radiante en planta baja, y el solado de toda la planta con una solera de hormigón pulido.

En la entreplanta se realiza también un nuevo solado de hormigón pulido y se dejan metidas alimentaciones eléctricas a los casetones de hormigón de planta baja en previsión para el alumbrado futuro.

Se han desarrollado trabajos de rehabilitación durante los años 2006 y 2007-2008. El año 2006 se procedió a la sustitución completa de la cubierta del edificio, y montaje de una nueva con una solución de menor peso y mayor aislamiento térmico, habiendo sido instalados unos ventiladores en la cumbrera del edificio para la ventilación de la planta alta.

En el año 2013, se redacta el proyecto de rehabilitación completa del pabellón de cristal, realizándose las obras de manera parcial. Asimismo, se realiza el proyecto de instalación eléctrica y protección contra incendios, dentro del cual se realizan los exutorios de fachada.

Reseña crítica

(La Arquitectura de Francisco Cabrero, Alberto Grijalba Bengoetxea y Francisco Cabrero, arquitecto, Javier Climent Ortiz)

Edificio proyectado en 1964 en colaboración con los arquitectos Jaime Ruiz y Luis Labiano y los ingenieros Anselmo Moreno y Rafael de Heredia.

Una característica preocupante de este edificio fue la urgencia de su construcción. Disponiendo de pocos meses, se decidió la estructura metálica. Ello dio lugar, por de pronto, a las grandes luces de la planta alta que exigía el programa. A ella accedía la tracción rodada de gran peso, por una rampa lateral. Toda esta

amplia y ligera jaula de hierro, contrastaba con una base de hormigón de gruesos elementos apilastrados, murales y solares, que formaban unidad semienterrada.

En el Pabellón de Cristal, Cabrero reduce el programa, en contra de los complejos ajustes a los que nos tiene acostumbrados en proyectos anteriores, a una sola imagen: un espacio diáfano cubierto y representativo. Así, en el pabellón, todo está enteramente diseñado y ajustado para poder conseguir la diafanidad de su sala superior; desde su estructura multibarrada de cubierta y de pilares hasta su planta baja porticada; desde el inmaterial cristal de su fachada hasta su uniforme reticulado de fachada.

Cabrero confía el éxito de su proyecto, no en dar soluciones a todos los condicionantes de un edificio, sino a la construcción de un único espacio, una única imagen, que sea capaz de relacionarse por la inmaterialidad de su cierre tanto con el interior como con el exterior.

El Pabellón de Cristal nos presenta una imagen homogénea en todos sus alzados, compuestos por un reticulado de acero y cristal, pero en puridad tal isotropía constructiva y estructural no es cierta.

En primer lugar, la estructura de la cubierta está formada por unas vigas en celosía unidireccionales, teniendo como luz el lado más corto de las dimensiones del rectángulo que limita su planta. Estas vigas se apoyan en unos pilares perimetrales, también en celosía, de modo que su ritmo es el que se manifiesta al exterior. Sin embargo, en los testeros, que podían estar tramados de un modo libre – pues no contienen estructura portante alguna-, Cabrero reproduce el mismo reticulado que en los alzados laterales, de modo que se nos presenta el edificio como si todo él fuera una estructura espacial reticulada, mientras que, en realidad, es un edificio porticado unidireccional.

El Pabellón exhibe una fachada continua en las dos plantas que lo componen, y sin embargo, el sistema estructural de las dos es totalmente diferente. Si el techo de la planta primera, como ya hemos visto, esta soportado por unos pilares en celosía perimetrales, el techo de planta baja está sustentado por veinticuatro pilares de hormigón armado. De este modo, la supuesta imagen homogénea estructural del edificio se rompe, la retícula acristalada de la planta baja es simulada exactamente igual que la de los testeros de planta primera.

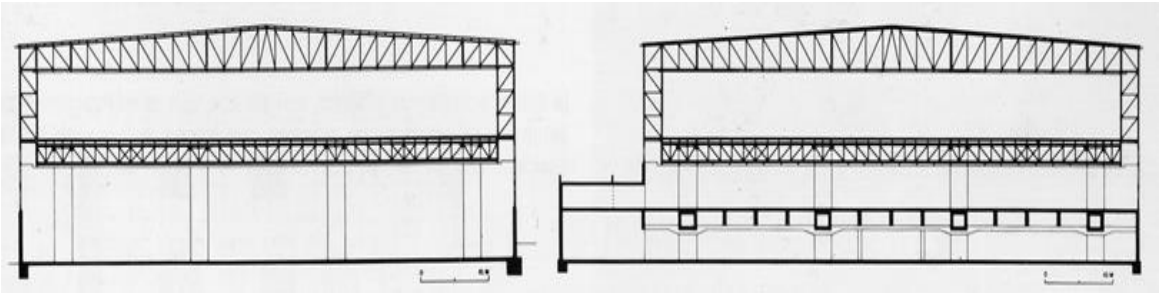

Figura 9. Secciones Transversales

La recurrente frase “less is more” con la que Mies explica su concepción de la arquitectura –que no debe entenderse como el despojar de los edificios de todo lo que se considera superfluo, sino como la reducción e insistencia en torno a un número limitado de problemas- podría aplicarse al Pabellón de Cristal de la Casa de Campo. La reducción elementarista, tanto de objetivos como de medios es una realidad en esta obra de Cabrero.

Constructiva y estructuralmente, Cabrero limita al máximo el número de elementos que componen su pabellón, en aras de una perfecta definición del mismo. Esta simplificación podría tener dos explicaciones independientes, pero a la vez complementarias: el corto tiempo con el que se había de construir la obra, ocho meses, y el deseo de un máximo control formal y constructivo de la obra. Así, Cabrero, mediante una estricta retícula cuadrada, tanto estructural como compositiva, reduce al mínimo el número de partes constituyentes del edificio, de modo que puede ejercer un control total la construcción, mejor si es sencilla, casi inmediata”. De este modo, Cabrero construye el pabellón como pretendiendo decirnos que cuanto más reducido es el número de elementos, menor es la desviación del proyecto.

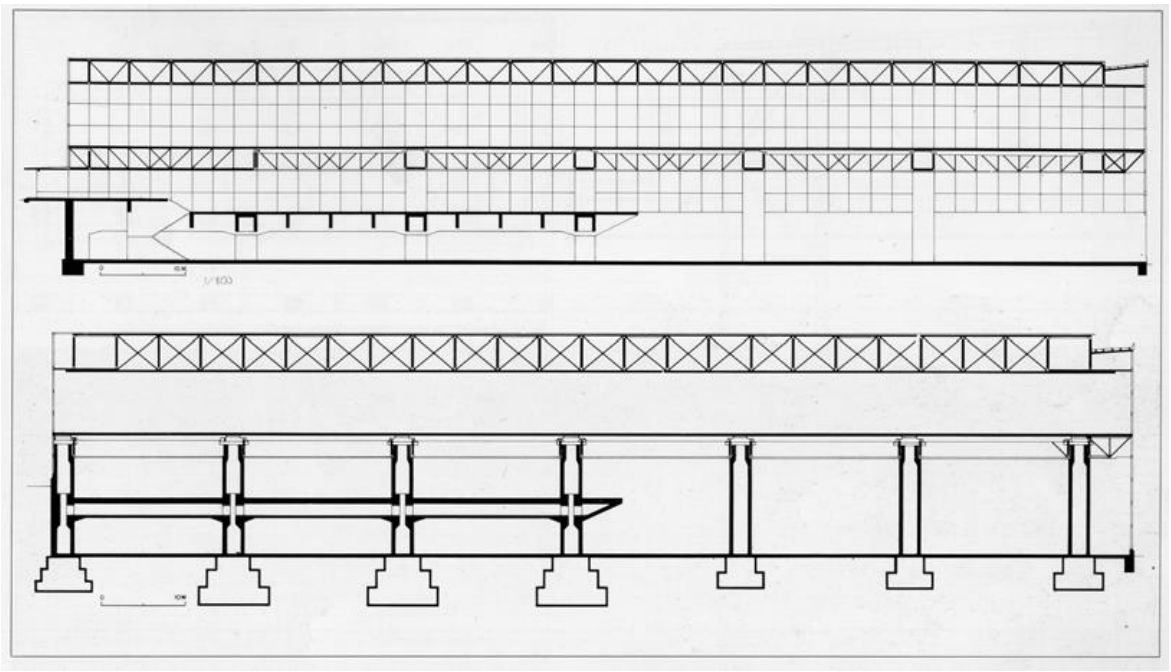

Figura 10. Secciones longitudinales

Cabrero, en su condición de constructor frío y meticuloso, sabe que el proceso de construcción de una obra está rodeado de una serie de condicionantes técnicos y programáticos -por parte de la empresa y de la propiedad- que se interponen entre la idea matriz del proyecto y la realidad construida. Así, el arquitecto, al reducir de un modo riguroso la cuantía de elementos constructivos y el programa de usos, consigue una identificación plena entre el proceso intelectual del proyecto y la presencia física del Pabellón de Cristal, sin intermediario alguno que pueda interferir, de ningún modo substancial, en el proceso de ejecución.

Cabrero desdobla la realidad de un edificio en dos. Una porticada que resuelve las necesidades programáticas del edificio y otra diáfana, que se convierte en el espacio representativo del proyecto. A dos sistemas estructurales diferentes les hace corresponder dos usos diferentes. Este desdoblamiento identifica su propuesta, mientras que el diferente tratamiento de la relación de las dos realidades del edificio los distancia, como demuestra la presencia nocturna del pabellón.

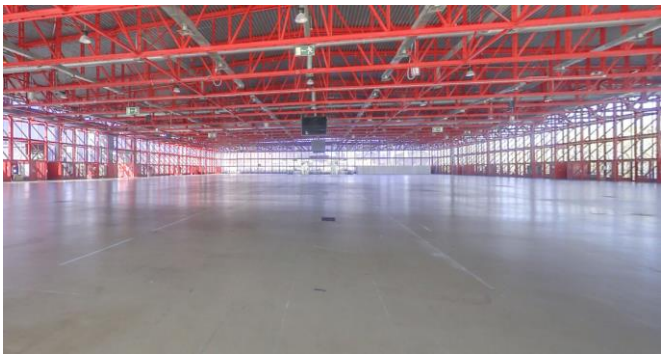
Cabrero identifica los dos espacios bajo un volumen común para reafirmar la reducción semántica de su proyecto: un espacio diáfano cerrado por cristal. De este modo, la sala representativa asimila volumétricamente su zócalo, implementando así su presencia.

El pabellón presenta una imagen homogénea en todos sus alzados, compuestos por un reticulado de acero y cristal. Desde el año 2005 se han realizado varias intervenciones dentro de un plan de rehabilitación integral del edificio, con el fin último de recuperar el aspecto edificio original. En estas rehabilitaciones se ha sustituido la cubierta de planta alta y se ha ejecutado una central térmica anexa para ubicar los sistemas primarios de climatización.

Figura 11. Fachada principal del edificio

El Pabellón de Cristal cuenta con tres plantas y un total de superficie de 24.202 metros cuadrados. La planta alta se resuelve sin pilares intermedios, ofreciendo una superficie diáfana de 72,50 x 127,50 metros. Este espacio que se utiliza como recinto ferial. También existe una zona de aseos para el público.

En la entreplanta hay una zona para eventos feriales, aseos para el público, y otra zona anexa de oficinas, cafetería, cocina y una sala polivalente.



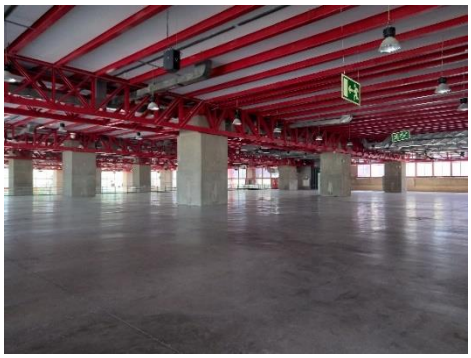


Figura 12. Planta primera y entreplanta

En planta baja existe la zona para eventos feriales, aseos de público y vestuarios para el personal, también están las salas técnicas y almacenes. La entreplanta del edificio no cubre la totalidad de la superficie de planta, por lo que en planta baja se disponen espacios a una y dos alturas.

Figura 13. Planta baja. Parte de la planta baja dispone doble altura

Figura 16. Planta alta

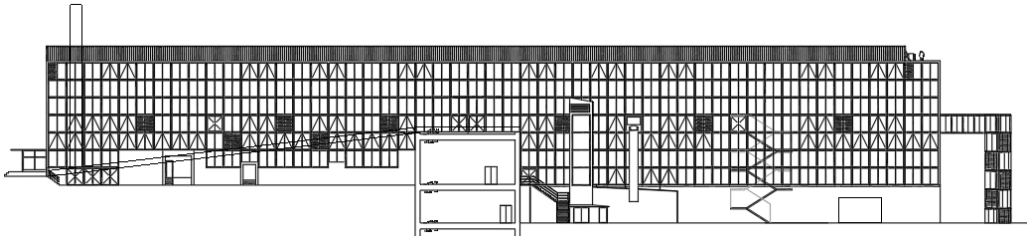

Figura 17. Alzado sur

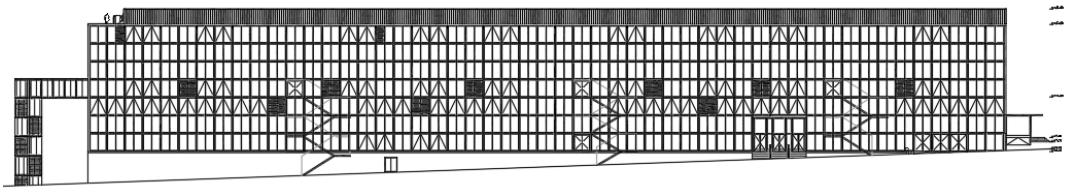

Figura 18. Alzado norte

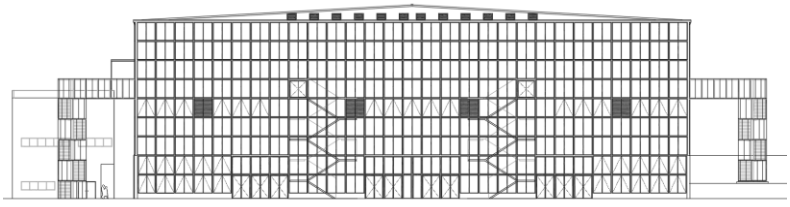

Figura 19. Alzado este

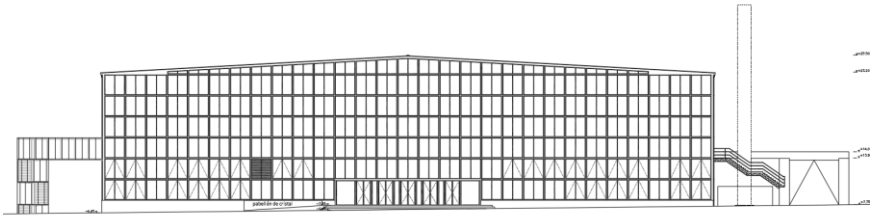

Figura 20. Alzado oeste

Envolvente térmica

- Cerramiento exteriores: Atendiendo al proyecto y a lo observado en las visitas, la fachada es en su totalidad acristalada, tipo muro cortina, con carpinterías metálicas y vidrios laminares. Parte de la fachada de planta baja y la fachada del edificio anexo se compone de muro de hormigón armado. En planta baja, este muro se encuentra parcialmente enterrado.
- Cubierta 1: Cubierta ligera de baja inclinación compuesta por una chapa de aluminio, 18 cm de aislamiento de lana de roca y aluminio anodizado por el exterior.
- Cubierta 2: Cubierta inclinada de hormigón armado para el acceso de vehículos a la planta primera.
- Suelos: El edificio no dispone de forjado sanitario, quedando el forjado de planta baja en contacto con el suelo.

Instalaciones

Para la climatización del Pabellón de Cristal se emplean principalmente equipos de generación de agua caliente y agua fría. Para la generación de agua caliente se produce en dos calderas de gas natural y la generación de agua fría mediante cuatro enfriadoras aire-agua. En algunos espacios se emplean unidades autónomas. El sistema de refrigeración empleado en el edificio genera agua fría para fan coils y climatizadoras. El inmueble cuenta con un sistema de aporte mecánico de aire exterior. En grandes estancias se han detectado equipos de extracción de aire de gran potencia. Se ha observado que en las estancias principales se dispone de luminarias muy eficientes. Actualmente se aprovecha la luz natural para iluminar gran cantidad de los espacios.

Para finalizar, el edificio no contiene ningún aporte de energía renovable (fotovoltaica, biomasa, mini eólica, etc.).

Cuadros de superficies

El presente proyecto no actúa sobre los espacios interiores ni modifica las distribuciones por lo que las superficies del estado actual no se modifican y serán las mismas en el estado actual y reformado.

1.6. DESCRIPCIÓN GENERAL DE LAS OBRAS A ACOMETER

El edificio tiene un uso de ocio y hostelería. Con el presente proyecto, no se modifica el uso del edificio ni los espacios existentes dentro del mismo.

Las actuaciones a realizar que se definen en el presente proyecto son:

- Renovación de toda la instalación de climatización y ventilación de la planta primera del edificio.
- Renovación de la instalación eléctrica correspondiente a la instalación de climatización.

1.6.1. Descripción de acceso y evacuación

El acceso principal del edificio se encuentra situado en la fachada oeste. En la fachada sur dispone de un acceso rodado hasta la planta primera. La fachada este también cuenta con accesos secundarios y de evacuación.

Figura 21. Alzado este acceso principal

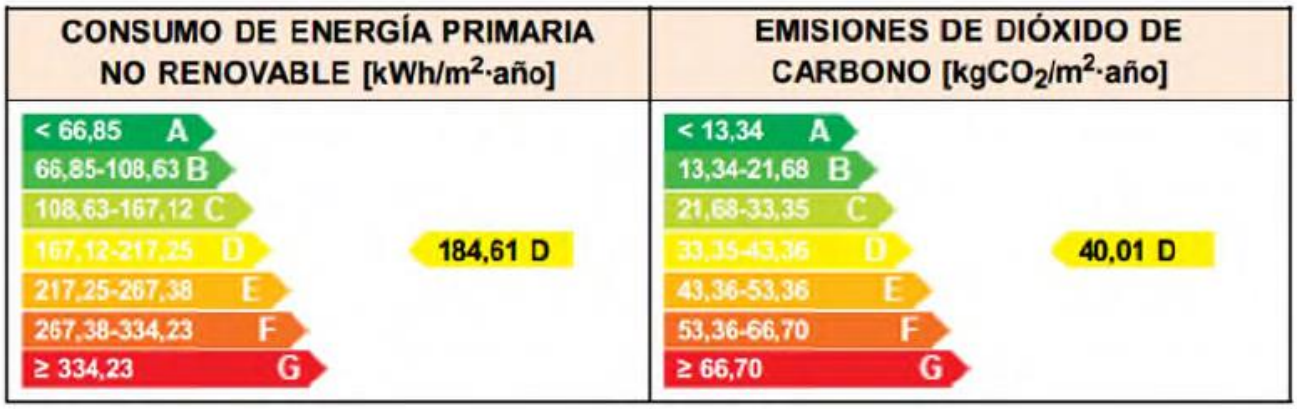

Figura 22. Alzado oeste accesos secundarios y de evacuación

1.6.2. Localización de los servicios urbanos existentes o por establecer

El edificio objeto de este proyecto cuenta con todos los servicios urbanos y acometidas.

1.7. PRESTACIONES DEL INMUEBLE

A continuación, se expondrán aquellos aspectos del estado actual del inmueble relacionados con las exigencias actuales del CTE DB HE para poner en contexto su situación a nivel energético. Se ha realizado un certificado de eficiencia energética, en el cual se ha obtenido la siguiente calificación:

Por otro lado, se han analizado aquellos aspectos de la envolvente que se van a modificar y comparado sus situaciones actuales con las exigencias del CTE. Al encontrarse a unos 600 m sobre el nivel del mar, la zona climática que le corresponde es la D3 y, por tanto, los valores a cumplir de transmitancia en los elementos de la envolvente serían los siguientes:

Tabla 3.1.1.a - HE1 Valores límite de *transmitancia térmica*, U_{lim} [W/m²K]

Elemento	Zona climática de invierno					
	α	A	B	C	D	E
Muros y suelos en contacto con el aire exterior (U_S, U_M)	0,80	0,70	0,56	0,49	0,41	0,37
Cubiertas en contacto con el aire exterior (U_C)	0,55	0,50	0,44	0,40	0,35	0,33
Muros, suelos y cubiertas en contacto con espacios no habitables o con el terreno (U_T) Medianerías o particiones interiores pertenecientes a la *envolvente térmica* (U_{MD})	0,90	0,80	0,75	0,70	0,65	0,59
Huecos (conjunto de marco, vidrio y, en su caso, cajón de persiana) (U_H)*	3,2	2,7	2,3	2,1	1,8	1,80
Puertas con superficie semitransparente igual o inferior al 50%				5,7		

En base a la información recopilada en las diferentes visitas, se ha podido observar que elementos de la envolvente no cumplen con los requisitos actuales del CTE. Esto se puede observar en más detalle en el Certificado de Eficiencia Energética. Las actuaciones necesarias para la rehabilitación de la envolvente no son objeto de este proyecto sino que se definen tal y como se ha dicho anteriormente en uno proyecto paralelo a este.

En cuanto a sus instalaciones, el comportamiento energético del edificio también tiene mucho margen de mejora. Tal y como se describirá en el primer apartado de la memoria constructiva en mayor detalle, las instalaciones se encuentran en un estado de baja eficiencia y, desde la concepción del proyecto, se han ido salvando los problemas que han ido apareciendo, sin terminar de dar una respuesta unificada al conjunto de la misma pensando en la eficiencia del edificio.

Adicionalmente, son requisitos básicos, conforme a la Ley de Ordenación de la Edificación, los relativos a la funcionalidad, seguridad y habitabilidad. Se establecen estos requisitos con el fin de garantizar la seguridad de las personas, el bienestar de la sociedad y la protección del medio ambiente, debiendo los edificios proyectarse, construirse, mantenerse y conservarse de tal forma que se satisfagan estos requisitos básicos.

Requisitos básicos relativos a la funcionalidad

1. Utilización, de tal forma que la disposición y las dimensiones de los espacios y la dotación de las instalaciones faciliten la adecuada realización de las funciones previstas en el edificio.

   No es de aplicación en el presente proyecto.

2. Accesibilidad, de tal forma que se permita a las personas con movilidad y comunicación reducidas el acceso y la circulación por el edificio en los términos previstos en su normativa específica.

   No es de aplicación en el presente proyecto.

3. Acceso a los servicios de telecomunicación, audiovisuales y de información de acuerdo con lo establecido en su normativa específica.

   No es de aplicación en el presente proyecto.

4. Facilitación para el acceso de los servicios postales, mediante la dotación de las instalaciones apropiadas para la entrega de los envíos postales, según lo dispuesto en su normativa específica.

   No es de aplicación en el presente proyecto.

Requisitos básicos relativos a la seguridad:

1. Seguridad estructural (DB-SE), de tal forma que no se produzcan en el edificio, o partes del mismo, daños que tengan su origen o afecten a la cimentación, los soportes, las vigas, los forjados, los muros de carga u otros elementos estructurales, y que comprometan directamente la resistencia mecánica y la estabilidad del edificio.

   No es de aplicación en el presente proyecto.

2. Seguridad en caso de incendio (DB-SI), de tal forma que los ocupantes puedan desalojar el edificio en condiciones seguras, se pueda limitar la extensión del incendio dentro del propio edificio y de los colindantes y se permita la actuación de los equipos de extinción y rescate.

   No es de aplicación en el presente proyecto.

3. Seguridad de utilización (DB-SU), de tal forma que el uso normal del edificio no suponga riesgo de accidente para las personas.

   No es de aplicación en el presente proyecto.

Requisitos básicos relativos a la habitabilidad:

El edificio reúne los requisitos de habitabilidad, salubridad y funcionalidad exigidos para el uso al que se destina.

1. Higiene, salud y protección del medio ambiente (DB-HS), de tal forma que se alcancen condiciones aceptables de salubridad y estanqueidad en el ambiente interior del edificio y que éste no deteriore el medio ambiente en su entorno inmediato, garantizando una adecuada gestión de toda clase de residuos.

   Es de aplicación en el presente proyecto al renovarse los sistemas de ventilación de la planta alta del edificio. Se reflejará con mayor profundidad en el apartado 3.1 Salubridad de la presente memoria de proyecto y en el anexo de cálculo de las instala

2. Protección contra el ruido (DB-HR), de tal forma que el ruido percibido no ponga en peligro la salud de las personas y les permita realizar satisfactoriamente sus actividades.

   No es de aplicación en el presente proyecto

3. Ahorro de energía y aislamiento térmico (DB-HE), de tal forma que se consiga un uso racional de la energía necesaria para la adecuada utilización del edificio.

   Como se indicaba en el apartado "Cumplimiento del Programa de necesidades", las actuaciones previstas en el Proyecto van encaminadas al ahorro energético bajo las siguientes premisas:

   I. Actuaciones que alcancen la mejor calificación energética, A o B, medida en la escala de emisiones de dióxido de carbono, de forma que el edificio obtenga la consideración de edificio de consumo de energía casi nulo y justifiquen una reducción mínima del 30% del consumo de energía primaria.

   La calificación energética se realizará y acreditará de acuerdo con el Real Decreto 390/2021, de 1 de junio, por el que se aprueba el procedimiento básico para la certificación de la eficiencia energética de los edificios, mediante la utilización de alguno de los programas informáticos o procedimientos reconocidos.

   II. Actuaciones que mejoren al menos una letra la calificación energética del edificio y que justifiquen una reducción mínima del 30% del consumo de energía primaria en los sistemas afectados por la actuación, cumpliendo con una o varias de las exigencias básicas de ahorro de energía para edificios existentes del Documento Básico DB-HE de Ahorro de Energía del Código Técnico de la Edificación, según corresponda con la actuación a realizar, incluidas las instalaciones de almacenamiento detrás del contador asociadas a instalaciones de autoconsumo eléctrico.

En el análisis previo al proyecto se estudió y determinó la composición de los elementos que conforman el edificio y como influyen en el consumo energético del edificio. Con el fin de disminuir dicho consumo se han determinado las medidas de ahorro energético que se exponen a continuación:

- Actuación sobre la envolvente de los edificios de manera que se minimicen las perdidas energéticas a través de ella para ello se procederá a:
    - Renovación de la envolvente del edificio. Esta actuación es objeto de un proyecto paralelo a este.
- Actuación sobre las instalaciones de los edificios de manera que se minimicen las perdidas energéticas para ello se procederá a:
    - Ejecución de nuevo sistema de climatización y ventilación de la planta alta mediante instalación de unidades de tratamiento de aire

Con estas actuaciones se consigue alcanzar el objetivo marcado de mejorar una letra y reducir al menos un 30% el consumo de energía primaria.

1.7.1. Limitaciones de uso

Limitaciones de uso del edificio en su conjunto

- El edificio sólo podrá destinarse a los usos previstos en el proyecto primitivo del mismo.
- La dedicación de alguna de sus dependencias a un uso distinto del proyectado requerirá de un proyecto de reforma y cambio de uso que será objeto la autorización administrativa correspondiente.
- Este cambio de uso será posible siempre y cuando el nuevo destino no altere las condiciones del resto del edificio ni menoscabe las prestaciones iniciales del mismo en cuanto a estructura, instalaciones, etc.

Limitaciones de uso de las dependencias

- Aquellas que incumplan las precauciones, prescripciones y prohibiciones de uso referidas a las dependencias del inmueble, contenidas en el Manual de Uso y Mantenimiento del edificio.

Limitaciones de uso de las instalaciones

- Aquellas que incumplan las precauciones, prescripciones y prohibiciones de uso de sus instalaciones, contenidas en el Manual de Uso y Mantenimiento del edificio.

1.7.2. Prestaciones que superan los umbrales establecidos en el CTE

No se han incluido en el presente proyecto prestaciones que superen los umbrales establecidos en el código técnico de la edificación, en relación a los requisitos básicos de funcionalidad, seguridad y habitabilidad.

2. MEMORIA CONSTRUCTIVA

2.1. DESCRIPCIÓN DETALLADA DE LA SOLUCIÓN PROPUESTA

2.1.1. Demoliciones y desmontajes.

En primer lugar, se procederá al desmontaje de las canalizaciones de la instalación de climatización y ventilación existente en la planta alta, las canalizaciones de alimentación de agua del sistema serán desmontadas hasta su encuentro con las canalizaciones generales que conducen hasta las calderas y enfriadoras, estos últimos elementos no son objeto de modificación en el presente proyecto. También se desmontarán todos los elementos existentes en la planta alta (Fan coil, extractores, Split, etc…)

Se levantará la instalación eléctrica que alimenta los actuales equipos interiores y sus cuadros eléctricos.

2.1.2. Instalación de climatización/ventilación

Se realizará la instalación de climatización y ventilación de acuerdo con las indicaciones y cálculos contenidos en el presente proyecto. Se instalarán nuevos conductos que distribuirán el aire climatizado desde los elementos productores hasta los puntos de uso. Se instalarán nuevas unidades de tratamiento de aire (UTA) que serán las encargadas de la climatización efectiva de las estancias interiores.

Con la nueva instalación no se contempla la sustitución de las calderas de gasoil ni las enfriadoras existente.

2.1.3. Justificación de la solución adoptada

Descripción de las características técnicas y energéticas de los elementos o sistemas a utilizar en base a la localización geográfica.

Tal y como se ha expuesto anteriormente, los valores límite de transmitancia del CTE DB HE debido a la zona climática son los siguientes:

Tabla 3.1.1.a - HE1 Valores límite de *transmitancia térmica*, U_{lim} [W/m²K]

Elemento	Zona climática de invierno					
	α	A	B	C	D	E
Muros y suelos en contacto con el aire exterior (U_S, U_M)	0,80	0,70	0,56	0,49	0,41	0,37
Cubiertas en contacto con el aire exterior (U_C)	0,55	0,50	0,44	0,40	0,35	0,33
Muros, suelos y cubiertas en contacto con espacios no habitables o con el terreno (U_T) Medianerías o particiones interiores pertenecientes a la *envolvente térmica* (U_{MD})	0,90	0,80	0,75	0,70	0,65	0,59
Huecos (conjunto de marco, vidrio y, en su caso, cajón de persiana) (U_H)*	3,2	2,7	2,3	2,1	1,8	1,80
Puertas con superficie semitransparente igual o inferior al 50%				5,7		

En base a estos requerimientos, las soluciones planteadas en proyecto incluyendo las actuaciones a realizar en las fachadas y que son objeto de otro proyecto independiente del presente, cumplen con estos valores según se justifica en la memoria en el apartado de cumplimiento del CTE DB HE de los anejos.

Contribución de la actuación a los Hitos y Objetivos CID (Council Implementing Decision)

Tras realizar el CEE del Estado Reformado del Edificio, se ha obtenido la siguiente calificación energética:

CONSUMO DE ENERGÍA PRIMARIA NO RENOVABLE [kWh/m^2·año]	EMISIONES DE DIÓXIDO DE CARBONO [kgCO_2/m^2·año]
< 50,90 A 50,90-82,71 B 82,71-127,24 C 127,24-165,41 D 165,41-203,58 E 203,58-254,48 F ≥ 254,48 G 115,43 C	< 10,42 A 10,42-16,93 B 16,93-26,05 C 26,05-33,86 D 33,86-41,67 E 41,67-52,09 F ≥ 52,09 G 24,93 C

2.1.4. Planificación de la actuación

El plazo de ejecución previsto para las obras es de **SEIS (6) meses**. Se adjunta en el anejo II de esta memoria el programa de trabajos a ejecutar.

2.1.5. Criterios de intervención

Criterios sobre la intervención de adecuación, conservación y restauración

En este caso, al tratarse de un proyecto cuyo objetivo principal es la mejora del mismo en términos de consumo de energía primaria no renovable y de emisiones de CO_2.

Las soluciones se van a plantear con los siguientes criterios principales, tal y como se puede observar en los apartados posteriores:

MEDIDAS ACTIVAS:

- Se eliminan todas las unidades de climatización existentes en la planta alta del edificio manteniendo las calderas y enfriadoras ya instaladas.
- Se aprovechan las canalizaciones generales que transportan el agua climatizada desde las enfriadoras y calderas a través de la galería de instalaciones existente que conecta el pabellón con las salas de instalaciones.
- Se diseña una solución que renueva la instalación interior de climatización/ventilación de la planta alta y a su vez con un sistema BMS permite el máximo control y automatización de esta.

En base a estos criterios, se realizan las propuestas descritas y desarrolladas en profundidad en los siguientes documentos del proyecto.

3. CUMPLIMIENTO DE LA NORMATIVA VIGENTE

3.1. CUMPLIMIENTO DEL CTE

El Código Técnico de la Edificación es la normativa más general en el ámbito de la edificación y abarca diferentes aspectos de los proyectos, pero en algunas cuestiones se aplica tanto el Código Técnico como otra normativa de carácter estatal, autonómico o local que completa las exigencias del Código Técnico. Se justificará el cumplimiento de toda la normativa que afecte al proyecto en concreto.

Si se entendiera que el proyecto no entra dentro del ámbito de aplicación de alguno de los Documentos Básicos del Código Técnico o de otra normativa también se justificará este extremo. Si el proyecto entrara dentro del ámbito de aplicación de una normativa, pero concurriera alguna circunstancia que no hiciera posible el cumplimiento de sus exigencias se justificará este extremo y las medidas alternativas que, en su caso, se hubieran adoptado.

La justificación de cumplimiento de parte de la normativa puede remitirse a la memoria constructiva de la estructura o a la memoria de alguna instalación si estuviera relacionado con la misma. En cualquier caso, el apartado de "Cumplimiento de la normativa" incluirá una página donde se especifique en qué lugar de la memoria se ha justificado la normativa que no se encuentra directamente justificada en ese apartado.

3.1.1. Seguridad estructural (DB-SE)

Las actuaciones que contempla el presente proyecto no suponen ningún tipo de actuación sobre la estructura existente ni sobre las cargas que actúan sobre ella ya que únicamente se actúa sobre sistemas de climatización y ventilación. **No procede la aplicación del Documento Básico DB-SE.**

3.1.2. Seguridad en caso de incendio (DB-SI)

Sección SI-1: Propagación interior

Compartimentación en sectores de incendio

No es de aplicación en el presente proyecto.

Espacios ocultos. Paso de instalaciones a través de elementos de compartimentación de incendios

La compartimentación contra incendios de los espacios ocupables tiene continuidad en los espacios ocultos, tales como patinillos, cámaras, falsos techos, suelos elevados, etc., salvo cuando éstos se compartimentan respecto de los primeros al menos con la misma resistencia al fuego, pudiendo reducirse ésta a la mitad en los registros para mantenimiento.

Se limita a tres plantas y una altura de 10 m el desarrollo vertical de las cámaras no estancas en las que existan elementos cuya clase de reacción al fuego no sea B-s3-d2, BL-s3-d2 o mejor.

La resistencia al fuego requerida en los elementos de compartimentación de incendio se mantiene en los puntos en los que dichos elementos son atravesados por elementos de las instalaciones, tales como cables,

tuberías, conducciones, conductos de ventilación, etc., excluidas las penetraciones cuya sección de paso no exceda de 50 cm².

Para ello, se optará por una de las siguientes alternativas:

- Mediante elementos que, en caso de incendio, obturen automáticamente la sección de paso y garanticen en dicho punto una resistencia al fuego al menos igual a la del elemento atravesado; por ejemplo, una compuerta cortafuegos automática EI t(i-o) ('t' es el tiempo de resistencia al fuego requerido al elemento de compartimentación atravesado), o un dispositivo intumescente de obturación.
- Mediante elementos pasantes que aporten una resistencia al menos igual a la del elemento atravesado, por ejemplo, conductos de ventilación EI t(i-o) ('t' es el tiempo de resistencia al fuego requerido al elemento de compartimentación atravesado).

Reacción al fuego de elementos constructivos, decorativos y de mobiliario

Los elementos constructivos utilizados cumplen las condiciones de reacción al fuego que se establecen en la tabla 4.1 (CTE DB SI 1 Propagación interior).

Las condiciones de reacción al fuego de los componentes de las instalaciones eléctricas (cables, tubos, bandejas, regletas, armarios, etc.) se regulan en el Reglamento Electrotécnico de Baja Tensión (REBT-2002).

Designación del elemento	Norma	Proyecto
Zonas ocupables	Techos y paredes	
	C-s2, d0	C-s2, d0
	Suelos	
	E_{FL}	E_{FL}

Designación del elemento	Norma	Proyecto
Local de riesgo especial	Techos y paredes	
	B-s1, d0	B-s1, d0
	Suelos	
	B_{FL}-s1	B_{FL}-s1

Designación del elemento	Norma	Proyecto
Espacios ocultos no estancos: patinillos, falsos techos, suelos elevados	Techos y paredes	
	B-s3, d0	B-s3, d0
	Suelos	
	B_{FL}-s2	B_{FL}-s2

Sección SI-2: Propagación exterior

De acuerdo con los criterios generales de aplicación del DB «En las obras de reforma en las que se mantenga el uso, este DB debe aplicarse a los elementos del edificio modificados por la reforma, siempre que ello suponga una mayor adecuación a las condiciones de seguridad establecidas en este DB»

En fachadas, se limita el riesgo de propagación exterior horizontal del incendio mediante el control de la separación mínima entre huecos de fachada pertenecientes a sectores de incendio distintos, entendiendo que dichos huecos suponen áreas de fachada donde no se alcanza una resistencia al fuego mínima EI 60.

La clase de reacción al fuego de los sistemas constructivos de fachada que ocupen más del 10% de su superficie será, en función de la altura total de la fachada:

- D-s3,d0 en fachadas de altura hasta 10 m.
- C-s3,d0 en fachadas de altura hasta 18 m.
- B-s3,d0 en fachadas de altura superior a 18 m.

Dicha clasificación debe considerar la condición de uso final del sistema constructivo incluyendo aquellos materiales que constituyan capas contenidas en el interior de la solución de fachada y que no estén protegidas por una capa que sea EI30 como mínimo.

En aquellas fachadas de altura igual o inferior a 18 m cuyo arranque inferior sea accesible al público desde la rasante exterior o desde una cubierta, la clase de reacción al fuego debe ser al menos B-s3,d0 hasta una altura de 3,5 m como mínimo.

No se contemplan actuaciones por el exterior del edificio ni en fachadas ni en cubierta. No procede en el presente proyecto.

Sección SI-3: Evacuación de ocupantes

No procede en el presente proyecto.

Sección SI-4: Instalaciones de protección contra incendios

No procede su justificación ya que no se realiza ninguna actuación sobre los sistemas de protección contra incendios del edificio.

Sección SI-5: Intervención de los bomberos

No procede su justificación al tratarse de una obra de reforma que no actúa sobre el entorno del edificio.

Sección SI-6: Resistencia al fuego de la estructura

No procede su justificación ya que no se realiza ninguna actuación sobre los elementos estructurales existentes en el edificio.

3.1.3. Seguridad de utilización y accesibilidad (DB-SUA)

El presente proyecto únicamente contempla actuaciones sobre el sistema de climatización y ventilación. Por tanto, al tratarse de un proyecto exclusivamente de instalaciones del edificio, queda fuera del ámbito de aplicación del Documento Básico DB-SUA.

3.1.4. Ahorro de energía (DB-HE)

El objetivo del requisito básico "Ahorro de energía" consiste en conseguir un uso racional de la energía necesaria para la utilización de los edificios, reduciendo a límites sostenibles su consumo y conseguir, asimismo, que una parte de este consumo proceda de fuentes de energía renovable, como consecuencia de las características de su proyecto, construcción, uso y mantenimiento.

Para satisfacer este objetivo, los edificios se proyectarán, construirán, utilizarán y mantendrán de forma que se cumplan las exigencias básicas establecidas.

Sección HE-0:Limitación del consumo energético

Esta sección es de aplicación a:

a) edificios de nueva construcción;

b) intervenciones en edificios existentes, en los siguientes casos:

- ampliaciones en las que se incremente más de un 10% la superficie o el volumen construido de la unidad o unidades de uso sobre las que se intervenga, cuando la superficie útil ampliada supere los 50 m^2;
- cambios de uso, cuando la superficie útil total supere los 50 m^2;
- reformas en las que se renueven de forma conjunta las instalaciones de generación térmica y más del 25% de la superficie total de la envolvente térmica final del edificio.

Las exigencias derivadas de ampliaciones y cambios de uso son de aplicación, respectivamente, a la parte ampliada y a la unidad o unidades de uso que cambian su uso, mientras que en el caso de las reformas referidas en este apartado, son de aplicación al conjunto del edificio.

Se excluyen del ámbito de aplicación:

a) los edificios protegidos oficialmente por ser parte de un entorno declarado o en razón de su particular valor arquitectónico o histórico, en la medida en que el cumplimiento de determinadas exigencias básicas de eficiencia energética pudiese alterar de manera inaceptable su carácter o aspecto, siendo la autoridad que dicta la protección oficial quien determine los elementos inalterables;

b) construcciones provisionales con un plazo previsto de utilización igual o inferior a dos años;

c) edificios industriales, de la defensa y agrícolas no residenciales, o partes de los mismos, de baja demanda energética. Aquellas zonas que no requieran garantizar unas condiciones térmicas de confort, como las destinadas a talleres y procesos industriales, se considerarán de baja demanda energética;

d) edificios aislados con una superficie útil total inferior a 50 m^2

En el caso de este edificio, tal y como se ha mencionado anteriormente, se redacta el presente proyecto para realizar una serie de medidas de mejora en la eficiencia energética en las instalaciones de generación térmica pero no considera actuaciones en la envolvente térmica del edificio por lo que no es de aplicación esta sección del documento básico.

Sección HE-1:Condiciones para el control de la demanda energética

Esta sección es de aplicación a:

a) edificios de nueva construcción;

b) intervenciones en edificios existentes:

- ampliaciones;
- cambios de uso;
- reformas.

Se excluyen del ámbito de aplicación:

a) los edificios protegidos oficialmente por ser parte de un entorno declarado o en razón de su particular valor arquitectónico o histórico, en la medida en que el cumplimiento de determinadas exigencias básicas de eficiencia energética pudiese alterar de manera inaceptable su carácter o aspecto, siendo la autoridad que dicta la protección oficial quien determine los elementos inalterables;

b) construcciones provisionales con un plazo previsto de utilización igual o inferior a dos años;

c) edificios industriales, de la defensa y agrícolas no residenciales, o partes de los mismos, de baja demanda energética. Aquellas zonas que no requieran garantizar unas condiciones térmicas de confort, como las destinadas a talleres y procesos industriales, se considerarán de baja demanda energética;

d) edificios aislados con una superficie útil total inferior a 50 m^2

Esta exigencia básica es de aplicación en el presente proyecto ya que se incluyen todas las obras de reforma. La justificación del cumplimiento queda recogida en el Anejo XI. CEE DEL ESTADO RESULTANTE.

Sección HE-2:Condiciones de las instalaciones térmicas.

A efectos de la aplicación del RITE se considerarán como instalaciones térmicas las instalaciones fijas de climatización (calefacción, refrigeración y ventilación) destinadas a atender la demanda de bienestar térmico e higiene de las personas, o las instalaciones destinadas a la producción de agua caliente sanitaria (ACS), incluidas las interconexiones a redes urbanas de calefacción o refrigeración y los sistemas de automatización y control.

El RITE se aplicará a las instalaciones térmicas en los edificios de nueva construcción y a las instalaciones térmicas que se reformen en los edificios existentes, exclusivamente en lo que a la parte reformada se refiere,

así como en lo relativo al mantenimiento, uso e inspección de todas las instalaciones térmicas, con las limitaciones que en el mismo se determinan.

Se entenderá por reforma de una instalación térmica todo cambio que se efectúe en ella y que suponga una modificación del proyecto o memoria técnica con el que fue ejecutada y registrada. En tal sentido, se consideran reformas las que estén comprendidas en alguno de los siguientes casos:

a) La incorporación de nuevos subsistemas de climatización o de producción de agua caliente sanitaria o la modificación de los existentes.

b) La sustitución de un generador de calor o frío por otro de diferentes características o la interconexión con una red urbana de calefacción o refrigeración.

c) La ampliación del número de equipos generadores de calor o frío.

d) El cambio del tipo de energía utilizada o la incorporación de energías renovables.

e) El cambio de uso previsto del edificio.

También se considerará reforma de una instalación térmica, a efectos de aplicación del RITE, la sustitución o reposición de un generador de calor o frío por otro de similares características, aunque ello no suponga una modificación del proyecto o memoria técnica.

Con independencia de que un cambio efectuado en una instalación térmica sea considerado o no reforma de acuerdo con lo dispuesto en el apartado anterior, todos los productos que se incorporen a la misma deberán cumplir los requisitos relativos a las condiciones de los equipos y materiales en el artículo 18 de este reglamento.

La justificación de este apartado queda recogido en el anejo VIII. CÁLCULO DE LA INSTALACIÓN DE CLIMATIZACIÓN/VENTILACIÓN

Sección HE-3: Condiciones de las instalaciones de iluminación

No procede su justificación ya que no se realiza ninguna actuación sobre la instalación de iluminación del edificio.

Sección HE-4: Contribución mínima de energía renovable para cubrir la demanda de agua caliente sanitaria.

No procede su justificación ya que no se realiza ninguna actuación sobre la instalación de agua caliente sanitaria (ACS).

Sección HE-5: Generación mínima de energía eléctrica procedente de fuentes renovables.

Esta sección es de aplicación en los siguientes casos:

a) edificios de nueva construcción cuando superen los 1.000 m^2 construidos

b) ampliaciones de edificios existentes cuando se incremente la superficie construida en más de 1.000 m^2

c) edificios existentes que se reformen íntegramente, o en los que se produzca un cambio de uso característico del mismo, cuando se superen los 1.000 m^2 de superficie construida;

El proyecto contempla la renovación del sistema de climatización y ventilación de la planta alta, no una reforma o ampliación del edificio por tanto, no es de aplicación en el presente proyecto.

Sección HE-6: Dotaciones mínimas para la infraestructura de recarga de vehículos eléctricos

Las condiciones establecidas en este apartado son de aplicación a edificios que cuenten con una zona destinada a aparcamiento, ya sea interior o exterior adscrita al edificio, en los siguientes supuestos:

a) edificios de nueva construcción;

b) edificios existentes, en los siguientes casos:

- cambios de uso característico del edificio;
- ampliaciones, en aquellos casos en los que se incluyan intervenciones en el aparcamiento y se incremente más de un 10% la superficie o el volumen construido de la unidad o unidades de uso sobre las que se intervenga, siendo, además, la superficie útil ampliada superior a 50 m2;
- reformas que incluyan intervenciones en el aparcamiento y en las que se renueve más del 25% de la superficie total de la envolvente térmica final del edificio.
- intervenciones en la instalación eléctrica del edificio que afecten a más del 50% de la potencia instalada en el edificio antes de la intervención, para aquellos casos en los que el aparcamiento se sitúe en el interior de la edificación, siempre que exista un derecho para actuar en el aparcamiento por parte del promotor que realiza dicha intervención;
- intervenciones en la instalación eléctrica del aparcamiento que afecten a más del 50% de la potencia instalada en el mismo antes de la intervención;

No es de aplicación esta exigencia básica ya que en el proyecto solo se contemplan actuaciones sobre el sistema de climatización y ventilación de la planta alta del edificio.

3.1.5. Protección frente al ruido (DB HR)

Se establece con carácter general para el CTE en su artículo 2 (Parte I) exceptuándose los casos que se indican a continuación:

a) los recintos ruidosos, que se regirán por su reglamentación específica;

b) los recintos y edificios de pública concurrencia destinados a espectáculos, tales como auditorios, salas de música, teatros, cines, etc., que serán objeto de estudio especial en cuanto a su diseño para el acondicionamiento acústico, y se considerarán recintos de actividad respecto a las unidades de uso colindantes a efectos de aislamiento acústico;

c) las aulas y las salas de conferencias cuyo volumen sea mayor que 350 m^3, que serán objeto de un estudio especial en cuanto a su diseño para el acondicionamiento acústico, y se considerarán recintos protegidos respecto de otros recintos y del exterior a efectos de aislamiento acústico;

d) las obras de ampliación, modificación, reforma o rehabilitación en los edificios existentes, salvo cuando se trate de rehabilitación integral. Asimismo, quedan excluidas las obras de rehabilitación integral de los edificios protegidos oficialmente en razón de su catalogación, como bienes de interés cultural, cuando el cumplimiento de las exigencias suponga alterar la configuración de su fachada o su distribución o acabado interior, de modo incompatible con la conservación de dichos edificios.

Por tanto, no es de aplicación esta exigencia básica ya que debido a sus características como edificio protegido y en todo momento se intenta mantener su actual configuración de fachada y acabados con el objetivo de la conservación del mismo.

3.1.6. Salubridad (DB-HS)

Sección HS-1: Protección frente a la humedad

No es de aplicación esta exigencia básica ya que en el proyecto solo se contemplan actuaciones sobre los sistemas de climatización y ventilación del edificio.

Sección HS-2: Recogida y evacuación de Residuos

Esta sección se aplica a los edificios de viviendas de nueva construcción, tengan o no locales destinados a otros usos, en lo referente a la recogida de los residuos ordinarios generados en ellos.

Para los edificios y locales con otros usos la demostración de la conformidad con las exigencias básicas debe realizarse mediante un estudio específico adoptando criterios análogos a los establecidos en esta sección.

No es de aplicación al tratarse de una obra de reforma y no de obra nueva.

Sección HS-3: Calidad del aire interior

Esta sección se aplica, en los edificios de viviendas, al interior de las mismas, los almacenes de residuos, los trasteros, los aparcamientos y garajes; y, en los edificios de cualquier otro uso, a los aparcamientos y los garajes. Se considera que forman parte de los aparcamientos y garajes las zonas de circulación de los vehículos.

Se consideran incluidos en el ámbito de aplicación los edificios de viviendas de cualquier tipo, incluso las viviendas aisladas, en hilera o pareadas.

Para locales de cualquier otro tipo se considera que se cumplen las exigencias básicas si se observan las condiciones establecidas en el RITE.

La justificación y cumplimiento de este apartado se recoge en el anexo VIII. “CÁLCULO DE LA INSTALACIÓN DE CLIMATIZACIÓN/VENTILACIÓN”.

Sección HS-4: Suministro de agua.

No es de aplicación esta exigencia básica ya que en el proyecto solo se contemplan actuaciones sobre los sistemas de climatización y ventilación del edificio.

Sección HS-5: Evacuación de aguas

No es de aplicación esta exigencia básica ya que en el proyecto solo se contemplan actuaciones sobre el sistema de climatización y ventilación de la planta alta del edificio.

Sección HS-6: Protección frente a la exposición al radón

Esta sección se aplica a los edificios situados en los términos municipales incluidos en el apéndice B, en los siguientes casos:

a) edificios de nueva construcción;

b) intervenciones en edificios existentes:

i) en ampliaciones, a la parte nueva;

ii) en cambio de uso, a todo el edificio si se trata de un cambio de uso característico o a la zona afectada, si se trata de un cambio de uso que afecta únicamente a parte de un edificio o de un establecimiento;

iii) en obras de reforma, a la zona afectada, cuando se realicen modificaciones que permitan aumentar la protección frente al radón o alteren la protección inicial.

La localidad en la que se ubica el proyecto, MADRID, no se encuentra dentro del apéndice B de la exigencia básica, por lo que no exige la realización de intervenciones que permitan aumentar la protección frente al radón.

3.2. CUMPLIMIENTO DE OTROS REGLAMENTOS Y DISPOSICIONES

No se contemplan otras normas de obligado cumplimiento que hayan de tenerse en cuenta a parte de las ya mencionadas en el proyecto.

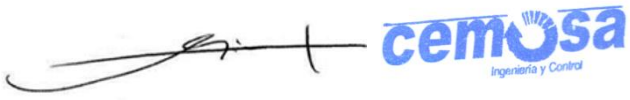
4. MEMORIA ADMINISTRATIVA

La memoria debe incorporar un apartado donde se detallen determinados aspectos que son necesarios para la futura contratación de la obra de acuerdo con la legislación de contratación vigente. La normativa de contratación pública vigente en este momento está formada por: el Texto Refundido de la Ley de Contratos del Sector Público, aprobado por Real Decreto Legislativo 3/2011, el RD 817/2009, por el que se desarrolla parcialmente la Ley de Contratos del Sector Público, y por aquellos artículos del RD 1098/2001, por el que se aprueba el Reglamento General de la Ley de Contratos de las Administraciones Públicos que no hayan sido derogados.

4.1. DECLARACIÓN DE OBRA COMPLETA



D. José Moriana Pericet, arquitecto colegiado número 375 del Colegio Oficial de Arquitectos de Córdoba con domicilio a efectos de notificaciones en C/ Innovación, 11; Pol. Ind. Los Olivos 28906. Getafe. Madrid.

CERTIFICA:

El presente proyecto se refiere a una obra completa que, una vez ejecutada con arreglo al mismo, será susceptible de ser entregada al uso que se destina, comprendiendo todos los elementos precisos para su utilización. Lo que se hace constar por el autor del Proyecto en cumplimiento del artículo 127.2 del Reglamento General de la Ley de Contratos de las Administraciones Públicas.

4.2. CLASIFICACIÓN DEL TIPO DE OBRA. CLASIFICACIÓN DEL CONTRATISTA

4.2.1. Clasificación del tipo de obra

De acuerdo con el artículo 232 de la Ley 9/2017, de 8 de noviembre, de Contratos del Sector Público, a los efectos de elaboración de los proyectos se clasificarán las obras, según su objeto y naturaleza, en los grupos siguientes:

a) Obras de primer establecimiento, reforma, restauración, rehabilitación o gran reparación.
b) Obras de reparación simple.
c) Obras de conservación y mantenimiento.
d) Obras de demolición.

Son obras de primer establecimiento las que dan lugar a la creación de un bien inmueble.

El concepto general de reforma abarca el conjunto de obras de ampliación, mejora, modernización, adaptación, adecuación o refuerzo de un bien inmueble ya existente.

Se consideran como obras de reparación las necesarias para enmendar un menoscabo producido en un bien inmueble por causas fortuitas o accidentales. Cuando afecten fundamentalmente a la estructura resistente tendrán la calificación de gran reparación y, en caso contrario, de reparación simple.

Si el menoscabo se produce en el tiempo por el natural uso del bien, las obras necesarias para su enmienda tendrán el carácter de conservación. Las obras de mantenimiento tendrán el mismo carácter que las de conservación.

Son obras de restauración aquellas que tienen por objeto reparar una construcción conservando su estética, respetando su valor histórico y manteniendo su funcionalidad.

Son obras de rehabilitación aquellas que tienen por objeto reparar una construcción conservando su estética, respetando su valor histórico y dotándola de una nueva funcionalidad que sea compatible con los elementos y valores originales del inmueble.

Son obras de demolición las que tengan por objeto el derribo o la destrucción de un bien inmueble.

Por tanto, atendiendo a los trabajos que se contemplan en el presente proyecto, las obras descritas se incluyen en el **Grupo a "Obras de primer establecimiento, reforma, restauración, rehabilitación o gran reparación."**

4.2.2. Propuesta de clasificación del contratista.

En este apartado se establece la propuesta de clasificación a exigir al contratista encargado de la realización de las obras objeto del proyecto. Se atenderá a la Ley 9/2017, de 8 de noviembre, de Contratos del Sector Público, por la que se transponen al ordenamiento jurídico español las Directivas del Parlamento Europeo y del Consejo 2014/23/UE y 2014/24/UE, de 26 de febrero de 2014, Libro primero, Título II, Capítulo II, Sección 1ª, Subsección 4ª Titulo II, Artículo 77 "Exigencia y efectos de la Clasificación":

"1. La clasificación de los empresarios como contratistas de obras o como contratistas de servicios de los poderes adjudicadores será exigible y surtirá efectos para la acreditación de su solvencia para contratar en los siguientes casos y términos:
